The Canadian Centre for Occupational Health and Safety (CCOHS) promotes a safe and healthy working environment by providing information and advice about occupational health and safety.

Each publication produced by CCOHS undergoes several stages of review. As part of this review, representatives from government, employers, and labour are requested to comment on draft copies of CCOHS documents for technical accuracy and readability.

Although every effort is made to ensure accuracy and completeness of the information, it is understood that CCOHS makes no warranty as to the accuracy or completeness of such information and assumes no liability for any damages or loss suffered as a result of any inaccuracy or incompleteness therein.

1. WHMIS 2015 - Instructor’s Toolkit

Objective
This Toolkit will provide you, the trainer, with the content and tools to introduce WHMIS (the Workplace Hazardous Materials Information System) and with WHMIS 2015 when it aligned with the Globally Harmonized System of Classification and Labelling of Chemicals (GHS). This Kit emphasizes the important information for workers and provides sample tests to help assess the worker’s understanding of the material. The Kit will highlight the information that workers need to know, and provides an overview of safe work practices and procedures for hazardous products used in the workplace.

By the end of their education and training, the overall goal is to make sure that the participants can answer four main questions:

- What are the hazards of the product?
- How are you protected from those hazards?
- What do you do in case of an emergency?
- Where can you get further information?

Scope
This course provides the trainer with the information and tools required to teach workers about WHMIS in the workplace. With WHMIS aligning with GHS, workers will see new hazard classes and categories, symbols, labels and safety data sheets.

This course provides:

- An overview of WHMIS
- A brief discussion of WHMIS 2015 (Canadian context)
- The main components of the WHMIS system
  - Labels
  - Safety data sheets (SDSs)
  - Hazard Classes/Categories
    - Summary of each hazard class, including pictograms (symbols)
- Guidance for workplace-specific training requirements
- Participant activities to enhance learning and retention
- Assessment tools including quizzes and a final test for documentation of learning
- Electronic slides for delivery of the course to workers
The Kit is organized using a module system allowing the trainer to customize the course by using the sections that are most relevant to their audience’s needs.

**Target Audience**

This Kit is intended for individuals who are responsible for WHMIS training in their workplace. It provides an introduction to WHMIS for workers and provides trainers with tools and guidance for this task.

The goal is to help workers understand what new information is being provided to them, and to help them interpret and use that information to keep themselves and co-workers safe.

The focus of this Kit is not to teach trainers (or workers) how to classify hazardous products or how to write safety data sheets.

This course is intended for all organizations that need to educate their workforce regarding WHMIS after alignment with GHS. The course places emphasis on the common hazard classes and workplace scenarios that are likely to be encountered by most businesses.

**Instructor Notes:**

- Please read this section before beginning. This section contains notes and advice about:
  1. The course layout and timing
  2. The content of the participant workbook and instructor manual
  3. The activities and overheads for the training course
  4. Recommended preparation for the instructor
  5. Advice for the instructor
Course layout and timing

When delivered in the classroom, the course is designed to be delivered in about 2 hours. The course focuses on the various elements, including labels, safety data sheets and the hazard classes. It also provides a brief background about GHS and WHMIS 2015.

Recommended duration for each section is given below:

<table>
<thead>
<tr>
<th>Section in Manual</th>

</table>
Contents of the participant workbook and instructor manual

As mentioned above, the participants will learn the background about WHMIS and the impact of GHS on WHMIS but the focus is on hazard classes, labels, and safety data sheets.

The material in this kit is modular – meaning the trainer can select which modules they wish to present. The hazards section of this course is fairly large. However, the organization may use only a small number of products that are covered by WHMIS. Because each workplace is unique, this kit is designed so the instructor can select the relevant hazard class information that matches the exact workplace or group.

As much as possible, the instructor should know which hazardous products the participants use before presenting the course so that the content can be tailored to each group’s needs.

There are also instructions to help guide workplace-specific training related to WHMIS. A worksheet included in the participant workbook encourages participants to answer and record important WHMIS and health and safety information that is specific to their workplace.

As with the hazard class information, to get the most out of this approach, the trainer should be prepared before the session with this information. CCOHS can provide guidance on the type of information required in a workplace, but we cannot provide the specifics for each workplace.

Activities and overheads for the course

This course has a variety of different activities for the course participants. Each section has review questions or an activity related to the content. These activities help the instructor assess whether the group understands the material. At the end of the course, there is a test. The test focuses primarily on the overall WHMIS information (rather than workplace-specific information). CCOHS recommends a minimum of 80% to pass the test. Individual workplaces may opt to require a higher percentage.

A Microsoft PowerPoint presentation is provided with the instructor manual. You can opt to show only the slides (e.g., hazard classes) that are relevant to your workplace. You can choose to use the slides in an electronic format (recommended) or you can print them to use with an overhead projector.
**Recommended advance preparation for the instructor**

Before the start of the session:

- Get a copy of an SDS for a product that is present in the workplace and use it for the SDS activity. Having a product that the participants are both familiar with and will use in their everyday work makes the exercise more applicable. If you wish, modify the questions about the SDS to further customize the questions that the class will answer. A sample SDS is provided if you wish to use it instead, or it may be used as a guide to reading an SDS in general.

- Discuss with the supervisor(s) of the group that will be attending the session and find out what hazardous products they use. Determine the classifications that apply to these products. Make sure that all current products, including ones that are not used often, are included in this review. Ensure that the hazard pictogram or hazard class discussions cover these items. You may choose to not present or to discuss briefly ones that are not present in that workplace; however, it is recommended that all pictograms and classes be discussed at least briefly so that participants understand the full range of classes.

- Discuss with the supervisor(s) the correct responses for the workplace-specific worksheet referred to in Section 3.

- Document the names of the participants, the date of the training, and the individual test results.

**Advice to the instructor**

Make sure there are enough participant manuals and that each participant has pencil/pen.

Make sure that you (the instructor) have the instructor manual and appropriate equipment for overhead display or PowerPoint slideshow. Test equipment ahead of time.

Ensure the classroom area is comfortable (e.g., heating/cooling, indoor air quality, background noise, etc.) and that appropriate facilities are available (e.g., washrooms).

Have everything ready before the start of the session. Greet the participants when they enter to put them at ease and to show them that they are important.

Encourage a friendly, supportive atmosphere and ensure that participants know that all questions related to the content are welcome.
2. Introduction to WHMIS (and WHMIS 2015)

- Introduction
- What is GHS?
- WHMIS 2015
- What does NOT change for WHMIS 2015
- What is covered by WHMIS
- Why is it important to work safely with hazardous products

Introduction

Many countries have regulatory systems for chemical classification and hazard communication. In Canada, this system is called WHMIS (Workplace Hazardous Materials Information System). If hazardous products are used in your workplace, employees should already be familiar with WHMIS. While the systems found in different countries often had similarities in terms of both content and purpose, there were always some differences in how products were classified, labelled, etc. This variation caused confusion about the classification of a product and consequently, how to handle the product safely.

What is GHS?

GHS stands for the “Globally Harmonized System of Classification and Labelling of Chemicals”.

GHS is a worldwide (global) system that defines and classifies the hazards of hazardous products and communicates health and safety information on labels and safety data sheets.

The goal is to harmonize or unify hazard communication by using the same set of rules for classifying hazards and the same format and content for labels and safety data sheets around the world. GHS has been in development for many years and was developed by an international team of hazard communication experts.

There are two main components that are key:

- Standardized classification of hazardous products into hazard classes and categories according to the specific rules.
- Standardized communication of hazard and precautionary information using labels and safety data sheets (SDSs). Suppliers are required to attach proper labels to hazardous products that are covered by that jurisdiction’s legislation, and provide current SDSs to customers.

Creating a global information system such as GHS provides many benefits, including:

- Providing improved, consistent hazard information
- Encouraging safe handling and use of hazardous products
- Promoting better emergency response
- Promoting regulatory efficiency and compliance with hazard communication requirements
- Facilitating trade between countries
• Reducing costs (once transition has completed)
• Reducing the need for product testing and evaluation

Why learn about WHMIS?
Learning about WHMIS will give you the knowledge to protect yourself and others from the hazards of exposures to chemicals and materials. The topics included are the basics of WHMIS, WHMIS hazard classes and their pictograms, labels and safe use and handling tips.

WHMIS 2015
In Canada, if a workplace uses hazardous products, there must already be a WHMIS program in place and workers must be knowledgeable about it.

WHMIS ensures that workers are informed about the hazardous products in the workplace and are trained to understand and work safely with these products. The key components of WHMIS are labels, safety data sheets (SDSs), and training/education for workers. **GHS does NOT replace WHMIS.** WHMIS has been updated to align with GHS elements.

With “WHMIS 2015”, there will be:
• New classification rules and hazard classes
• New hazard pictograms
• New supplier label requirements
• New format for Safety Data Sheets (SDSs)

What does NOT change for WHMIS 2015
It is important to stress that GHS does NOT replace the workplace management of hazards in areas such as education and training, control measures, personal protective equipment programs, etc. Good chemical management is considered a part of a workplace WHMIS program and that expectation continues. All of these initiatives remain the same.

Aspects of Canada's WHMIS program that will remain unchanged include:
• Worker education and training. These elements are the cornerstone of WHMIS, and include:
  – General or generic education (learning about WHMIS)
  – Workplace-specific training (applying the system to the workplace and ensuring workers understand how to apply the knowledge to their situation)
  – Making sure that education and training is effective and documented. Workers should be able to answer these questions:
    • What are the hazards of the product?
    • How do I protect myself from those hazards?
    • What do I do in case of an emergency?
    • Where can I get further information?
• Requirement for workplace labels (where product is transferred to other containers, supplier label is damaged, etc.).
• Requirement for safety data sheets (SDS) to be readily available and accessible for workers (e.g., can be available electronically or in binders; must be in an accessible location and not locked away). The SDS will look similar to the Material Safety Data Sheet (MSDS) but there are sections with new or different information.
• The WHMIS rules surrounding confidential business information will continue to apply.
• Continue to include some hazards that are currently not in the GHS system, but were in the previous WHMIS system - such as biohazardous infectious materials.
• Workplace responsibilities for workers, supervisors, employers

What is covered by WHMIS?
When any product meets the classification criteria (as established by Health Canada), it is considered a “hazardous product” according to the WHMIS legislation. As a hazardous product, a supplier must label the product or container, and they must provide an SDS to their customers.

Exclusions
Like previous WHMIS legislation, the alignment with GHS excluded some types of products from labelling and SDS requirements. These products are regulated by other laws. Three examples of excluded products include:

  – consumer products
  – explosives
  – pesticides such as insecticides, herbicides, fungicides, and other pest control products.

We mention these exclusions because you may have to work with some of these products in your workplace. You will receive training about how to work safely with them as part of a comprehensive health and safety program.

Why it is important to work safely with hazardous products?
Injuries or illness caused by exposures are preventable. Improper handling and storage, or not understanding the hazards or toxicity of a product can lead to serious physical harm. Some products can cause immediate damage after a short exposure; others may cause damage that is not apparent until days, months, or years have passed. When proper precautions are not used, products can be spread to other areas, such as washrooms, cafeterias, vehicles and even workers’ homes. Workers must understand the hazards of the materials they use, and be able to take the necessary precautions to protect their health and safety.

The overall goal is to have informed workers who understand the hazards of the products they work with, and know how to protect themselves and work safely with the products.
Participant Activity

Indicate the correct response(s).

True or False  GHS is a system that promotes clear and consistent hazard communication globally.

True or False  WHMIS will no longer exist after GHS is introduced.

With WHMIS aligned to GHS there are:

- New hazard classes
- New pictograms
- New label and SDS requirements
- All of the above

In your words, why is it important to work safely with hazardous products at your workplace?

____________________________________________________________________________
____________________________________________________________________________
____________________________________________________________________________
____________________________________________________________________________
____________________________________________________________________________
____________________________________________________________________________
____________________________________________________________________________
Participant Activity: Answers

Indicate the correct response(s).

True or False  
GHS is a system that promotes clear and consistent hazard communication globally.

True or False  
WHMIS will no longer exist after GHS is introduced. (Answer: False. WHMIS has aligned with GHS, but the principles of WHMIS remain.)

With WHMIS aligned to GHS there are:

- New hazard classes
- New pictograms
- New label and SDS requirements
- All of the above (correct answer)

In your words, why is it important to work safely with hazardous products at your workplace?

Answers include:

- everyone in the workplace has responsibilities
- prevents injuries or illness in the workplace
- some products can cause immediate damage while others may not appear for a period of time, and/or
- improper use of a product can spread it to other areas where unprotected individuals are (e.g., cafeteria, elevator, vehicles, washrooms, home).

3. Roles, Responsibilities and the Law

This section provides a brief overview of the Workplace Responsibility System, the Three Basic Workers’ Rights and groups of people who directly affect or influence how WHMIS 2015 is safely applied to the workplace. It also indicates what types of products are covered by WHMIS 2015 and what are the exclusions.

Saskatchewan established the first occupational health and safety act in 1972. The act was revised in 1977, 1993 and 2013 to bolster worker involvement and improve protection for health and safety.

A set of principles called the internal responsibility system (IRS) were used in 1972 original legislation. In Saskatchewan, we refer to the IRS as the workplace responsibility system (WRS).

The WRS is still the cornerstone of health and safety legislation. It means that it’s everyone’s responsibility to work together to identify and control hazards in the workplace. Everyone needs to take the time to ensure health and safety is part of all work at the workplace. Persons with the most authority in the workplace have the greatest responsibility for health and safety.

Employers have a legal and moral responsibility to provide a safe and healthy workplace.

Supervisors have a duty and responsibility to ensure workers they supervise follow the rules in the legislation and the employer’s health and safety system.

Workers must work safely by following the legislative requirements and the employers health and safety system. When you put all these responsibilities/requirements together, along with the OHCs and reps, you have the WRS.

For the WRS to succeed, worker participation is essential. They participate through the OHCs and representatives as selected by workers. Another important way workers participate in their health and safety is by talking to their supervisor.

Competent refers to when someone has been properly trained, equipped and experienced to perform a task. For the WRS to function properly, a workplace must have competent management, supervision and workers who work safely.

The legislation provides every worker (including managers and supervisors) with three fundamental occupational health and safety rights. Saskatchewan was the first to uphold these rights into health and safety legislation.

With WHMIS 2015, the right to know is an essential part of making the WRS work. Workers have the right to know about workplace hazards, including hazardous products, and how to control those hazards.

Workers must be:

- Informed about the hazards at work;
- Trained to recognize those hazards;
- Trained to protect himself or herself; and
- Informed about his or her rights under the law.
Workers share the responsibility with the employer for maintaining a healthy and safe workplace and have the right to participate in making health and safety decisions.

Workers also have the ability to raise health and safety concerns with their supervisor. This is extremely important for workers to participate at this level.

**WHMIS is the Law in Every Workplace**

WHMIS is a coordinated system of federal, provincial and territorial laws which apply to every workplace in Canada.

The federal laws do **four main things**:

1. Create WHMIS hazard classes and pictograms.
2. Describe the rules for classifying products as hazardous products.
3. Require suppliers to attach labels to chemical products that are hazardous products.
4. Require suppliers to provide SDSs to customers.

**WHMIS is the Law in YOUR Workplace**

Federal laws are the Hazardous Products Regulations (SOR/2015-17) and the Hazardous Products Act. The Hazardous Products Regulations allow suppliers and employers to apply for trade secret information.

All Canadian jurisdictions, including Saskatchewan, have adopted similar WHMIS regulations for employers. These laws were built on consensus between businesses, labour and government.

These Acts and regulations can be found online.

**These regulations require your employer to:**

- Obtain current SDSs for all WHMIS hazardous products.
- Make sure current SDSs are made readily available to you.
- Ensure that hazardous products are properly labelled.
- Educate you about WHMIS.
- Provide training on the hazards of WHMIS products in your workplace and on the necessary precautions.

Workplace-specific training is the most important part of WHMIS training. Your employer must provide this training.

How your Employer may organize site-specific WHMIS 2015 training is an included portion of this course.
Your Legal Responsibilities

Workers have specific responsibilities in WHMIS.

As a worker, you must:

- Take part in your education and training programs.
- Follow safe work procedures.
- Use your WHMIS training.
- Ask your employer where the SDSs are kept. Make sure they are current and readily available to you.
- Inform your employer about any hazards you see in the workplace.
- Inform your employer about deficiencies such as labels on containers that are no longer readable, damaged or lost.

Supplier Responsibilities

Suppliers (including manufacturers, importers and distributors) must:

- Classify products according to their hazards and the WHMIS criteria.
- Provide labels for the product or container.
- Provide a current SDS for WHMIS products sold to workplaces.

Who enforces WHMIS?

WHMIS is enforced by inspectors of Saskatchewan Occupational Health and Safety.

Inspectors may:

- Ask you specific questions about your knowledge of any part of the WHMIS program
- Ask you to show them an SDS for the product you work with
- Test your understanding of the content of the SDS or label
- See if you know about product hazards, safe work practices, or emergency procedures

Inspectors can also ask the manager or supervisor these questions, and about how well the WHMIS program is working.

Which workplace products are covered by WHMIS?

The WHMIS laws set out rules to determine if a workplace product is hazardous.

The rules are based on properties such as toxicity, flammability and reactivity. If one or more of the rules applies to a product, it is called a hazardous product.

If there are hazardous products in your workplace, you need WHMIS education and training.
Exclusions

Five categories of products are partially exempt from WHMIS requirements for labels and SDSs, but not WHMIS education and training requirements:

1. Consumer restricted products (those sold to the general public that are already labelled following the rules of the Canadian Consumer Product Safety Act).
2. Explosives (as defined by the Explosives Act).
3. Cosmetics, drugs, food or devices (as defined by the Food and Drugs Act).
4. Pest control products (for example pesticides as defined by the Pest Control Products Act).
5. A nuclear substance as defined by the Nuclear Safety and Control Act, that is radioactive.

Exempt from WHMIS Requirements for Labels and SDSs

Five categories of products are exempt from WHMIS requirements for labels and SDSs, but not WHMIS training requirements:

• Consumer restricted products (those products sold to the general public that are already labelled following the rules of the Hazardous Products Act)
• Explosives (as defined by the Explosives Act)
• Cosmetics, drugs, food or devices (as defined by the Food and Drugs Act)
• Pest control products (for example pesticides as defined by the Pest Control Products Act)
• Radioactive materials (as defined by the Nuclear Energy Act [external link], formerly the Atomic Energy Control Act)

These Acts are available to view online.

Exclusions (Continued)

Four categories of products are fully exempt from all WHMIS requirements:

1. Wood and products made of wood
2. Manufactured articles
3. Tobacco or products made of tobacco
4. Products being transported or handled pursuant to The Dangerous Goods Transportation Act and the Transportation of Dangerous Goods Act.

Hazardous wastes do not require SDSs and WHMIS labels, but the wastes still need to be labelled as hazardous waste and workers need to be educated and trained on safe handling procedures.
We mention these exclusions because...

You probably have some of these products at your workplace. These products use different labels, symbols or other ways to tell people about their hazardous properties.

If any of these categories of products are used in your workplace, your employer is required to give you information on the hazards and how to work safely with them. You must be provided this information before you start using these products. They can usually get an SDS from the supplier.

An example

A can of spray paint or WD-40® that you can buy in a retail store (for use at home or work) will have a consumer label on the can.

Be sure to follow any instructions on the packaging, can or box.

You are not required to have an SDS for these products, but it is a good idea to get the SDS so that you have more information about how to work safely with the product and any health, fire or reactivity hazards it may have.

You can often get an SDS for the product by contacting the manufacturer.
4. Components Of The Hazard Classification And Labelling System

This section provides an overview of the framework used for classification and introduces the elements that define the hazard classification system.

Before GHS, a product that would be classified as “toxic” under WHMIS in Canada might be labelled “harmful” in Europe and Australia. This same material would be “moderately toxic” in China, “hazardous” in New Zealand and “non-toxic” in India. While each country had good intentions, the use of so many different words and hazard levels for the same material is confusing (and potentially dangerous) for anyone trying to figure out what the hazards are and what precautions are needed. The purpose of aligning with GHS is to correct this inconsistency worldwide by using a common hazard classification system.

It is important to understand the basic elements. These terms are used repeatedly throughout this session and are key concepts for labels and safety data sheets (SDSs).

A) Elements

The elements that will be discussed in this section are:

- Hazard groups
- Hazard classes
- Hazard categories
- Pictograms
- Signal words
- Hazard statements
- Precautionary statements

Hazard Groups

WHMIS now identifies two major groups of hazards: physical and health.

Each hazard group includes hazard classes that have specific hazardous properties.

For example under the physical hazards group, there are hazard classes that are based on the physical or chemical properties of the product – such as flammable, oxidizing, and corrosive.

The health hazard group includes hazard classes that are able to cause a health effect - such as being an irritant to eyes, or being acutely toxic (poisonous).

It is not uncommon for a product to belong to more than one hazard group. For example, benzene has both hazardous physical and health properties.
Benzene is classified as:

- Flammable liquid - Category 2
- Carcinogenicity - Category 1
- Germ cell mutagenicity - Category 1
- Specific target organ toxicity - Repeated exposure - Category 1
- Aspiration hazard - Category 1
- Serious eye damage/eye irritation - Category 2
- Skin corrosion/irritation - Category 2

Hazard Classes

Each hazard group is divided further into hazard classes. Under WHMIS 2015, there are currently:

- 19 physical hazard classes
- 12 health hazard classes

There are also two environmental classes defined by GHS, but these classes are not mandatory in Canada. However, these classes will be introduced in this kit as the classes and pictograms may be identified on products.

Each of these hazard classes will be discussed in more detail later. The following table shows the hazard classes that belong under each hazard group:
Table 1: Hazard Groups and Classes

* Note: WHMIS is not adopting the explosive hazard class nor the environmental hazard classes. However, you may see these classes identified or the pictograms on products used in your workplace.
Hazard Categories

Each hazard class contains at least one category. Categories may be further broken down into sub-categories or types.

The category identifies the degree of hazard for the product. Category 1 is always the greatest level of hazard (e.g., most hazardous). A category 2 or 3 within the same hazard class would have a lower degree of hazard associated with it. Some hazard classes have only one category (e.g., corrosive to metals), others may have 2 categories (e.g., carcinogenicity (cancer)) or 3 (e.g., oxidizing liquids). There are a couple of hazard classes with many categories (e.g., organic peroxides, acute toxicity). Categories may also be identified with alphabetical references (e.g., A is a greater hazard than B, etc.)

Let’s use flammable liquids as an example:

“Flammable liquid” is a hazard class in the Physical Hazards group. Within the flammable liquid class there are four categories – each category is defined with different flash point ranges and/or boiling point cut-off values.

- Category 1: flash point <23 deg C and initial boiling point ≤35 deg C
- Category 2: flash point <23 deg C and initial boiling point >35 deg C
- Category 3: flash point ≥23 deg C and ≤60 deg C
- Category 4: flash point >60 deg C and ≤93 deg C

Category 1 has the lowest flash point and boiling point, making it the most hazardous category for handling and storage.

The objective is not to remember how many categories are in each hazard class. The key point to remember is that a category 1 in any hazard class has the greatest hazard.

This numbering system gives you clues about the precautions and control measures that will be required to prevent exposure. Learn to look for this information on labels and safety data sheets. If you are unsure about something, ask your supervisor.

Note: The Gases under pressure class contains 4 categories which are not used to indicate the degree of hazard. The categories (i.e., compressed gas, liquefied gas, refrigerated liquefied gas, and dissolved gas) are used to indicate the type of hazard present.

Similarly, while the Reproductive toxicity class uses categories 1 and 2 (which are ranked as above), the additional class of “effects on or via lactation” is considered to be a separate hazard (which is not ranked).
Hazard Pictograms

Hazard pictograms are used to represent the hazard classes. Each hazard class or category has an assigned hazard pictogram. Most pictograms have a distinctive “square on point” border which is solid red in colour. Inside this border is a symbol that represents the potential hazard (e.g., fire, health hazard, corrosive, etc.). Together, the symbol and the border are referred to as a pictogram. The biohazardous infectious material symbol remains the same round black circle as previously used in WHMIS 1988.

The pictogram provides an image that immediately shows a worker what type of hazard is present. This way, even with a quick glance, someone can realize that, for example, the product is a danger to health, corrosive, or may be a fire hazard.

The table below shows hazard pictograms. The bold type is the name given to of the picture, the words in the brackets describe the hazard. The hazard classes and the pictograms assigned to them will be discussed in more detail later.

Table 2: Pictograms – Names and Descriptions

<table>
<thead>
<tr>
<th>Exploding bomb (for explosive, unstable hazards)</th>
<th>Flame (for flammable hazards)</th>
<th>Flame over circle (for oxidizing hazards)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gas cylinder (for gases under pressure)</td>
<td>Corrosion (for corrosive damage to materials as well as skin, eyes)</td>
<td>Skull and Crossbones (very toxic material that can cause illness/death with small amounts and short exposures)</td>
</tr>
<tr>
<td>Health hazard (for materials that can cause serious health effects)</td>
<td>Exclamation mark (for materials that can cause health effects less serious than those using the health hazard pictogram)</td>
<td>Environment* (for materials that can cause damage to the aquatic environment or the ozone layer)</td>
</tr>
</tbody>
</table>

* The GHS system also defined an Environmental hazards group. This group (and its classes) was not adopted in WHMIS 2015. However, you may see the environmental classes listed on labels and SDSs. Including information about environmental hazards is allowed by WHMIS 2015.
Each pictogram may be used for more than one hazard class. As a quick example, here are the classes that use the flame pictogram. We will discuss pictograms and classes in more detail during this course.

Flame pictogram is used to indicate the following hazard classes:
- Flammable gases
- Flammable aerosols
- Flammable liquids
- Flammable solids
- Self-reactive substances and mixtures
- Pyrophoric liquids
- Pyrophoric solids
- Pyrophoric gases
- Self-heating substances and mixtures
- Substances and mixtures which, in contact with water, emit flammable gases
- Organic peroxides

**Hazard Statements**

Each hazard class and category has an assigned hazard statement. Hazard statements are brief, standardized sentences that describe the hazard of the product. The statements are short but describe the most significant hazard concerns with the product.

**Tip!**

The wording of the hazard statement helps to describe the degree of the hazard.

For example:

- “May cause cancer” is considered a stronger warning statement (more hazardous) than “Suspected of causing cancer”.

Examples of hazard statements include:

- Extremely flammable gas
- Contains gas under pressure; may explode if heated
- Fatal if inhaled
- Causes eye irritation
- May cause cancer
**Signal Words**

A signal word is another part of the hazard communication system. A signal word is another prompt to alert you about the degree of hazard associated with the product.

There are only two signal words. *“Danger”* or *“Warning”*. "Danger" is used for high risk hazards, while "Warning" is used for less severe hazards. Some of the hazard class/categories do not have a signal word assigned to them. If a signal word is assigned with a hazard class or category of a product, it must be shown on the label.

**Precautionary Statements**

Precautionary statements provide advice on how to minimize or prevent exposure to the product. These statements can include instructions about storage, handling, first aid, personal protective equipment and emergency measures. As with hazard statements, precautionary statements are standardized.

Examples of precautionary statements include:

- Keep container tightly closed
- Wear protective gloves/protective clothing/eye protection/face protection
- If exposed or concerned: Get medical advice/attention
- Fight fire remotely due to the risk of explosion
- Protect from sunlight

**Putting these elements together**

Together, the pictogram, signal word, hazard statement and the hazard class/category name provide the user with information about the hazards associated with that chemical. As shown in Table 3, skin corrosion/irritation category 1 uses the higher level warnings (corrosion pictogram, Danger (signal word) and a stronger worded hazard statement (Causes severe skin burns and eye damage).
Table 3: Elements of a label used to indicate the level of hazard

</tbody>
</table>
B) Labels

Types of Labels
There are different ways to label a hazardous product. In most cases, you will see supplier labels. You may also make workplace labels. Both of these types of labels are described below.

Supplier Labels
Labels are a critical component of the hazard communication system as they alert the person handling a product about the major hazards, and outline the basic precautions (safety steps) that should be used.

Supplier labels will look different with the alignment to GHS and will have a few new requirements over what WHMIS formerly required. With the new system, once a chemical is classified, a specific signal word, hazard statements, precautionary statements, and pictogram(s) are required (prescribed) for each hazard class and category.

The elements we just discussed such as the pictograms, signal words, hazard statements and precautionary statements will be grouped together on a label. The label will also include the product name and the supplier identification. Labels must be available in both English and French. There is no set format for a label, however. To find the label, look for the pictogram(s), signal word, and hazard statements.

A supplier label will have the following elements:

1. **Product Identifier** – name of the product
2. **Pictogram(s)** – the symbol that represents the hazard class. In some cases, no pictogram is required.
3. **Signal word** – a word used to alert the reader to a potential hazard and to indicate the severity of the hazard.
4. **Hazard statement(s)** – an assigned statement that describes the hazard(s)
5. **Precautionary statements** – standardized phrases that describe measures to be taken to minimize or prevent adverse effects resulting from exposure to a hazardous product or resulting from improper handling or storage of a hazardous product.
6. **Initial supplier identifier** – the name, address and telephone number of either the Canadian manufacturer or the Canadian importer.

Hazardous ingredients may or may not be listed on the label. Suppliers have this choice.
**Workplace Label**

A workplace label is used, for example, when you transfer a product to a new container. A workplace label may also be used when a product is made and used on-site or when the supplier label is missing or not readable.

A workplace label must have:
- product name (matching the SDS product name)
- safe handling precautions, which may include pictograms or other supplier label information
- a reference to the SDS (if available)

**Alternative identification**

Other ways to identify hazardous products may be used in the workplace in some situations. This alternative identification may include warning signs, symbols, placards and coding systems. They can be used as long as everyone in the workplace has had the appropriate education and training about the identification system.

Other means of identification are generally used:
- In a laboratory when transferring products to other containers
- By a worker when they are transferring to a container that they will have “control” of for the entire work shift, and it will be finished by the end of that shift
- When a product is inside a system such as a pipe, vessel, or tank car.

**What should a worker do?**

- Always check to see if there is a label on the product that you are going to be use.
- Read, understand and follow the instructions on the label and SDS. Ask the supervisor if you are unsure of any part of its use or storage.
- Ask for a new label when the old one cannot be seen or read properly.
- Do not use a product that is not labelled.
- Receive WHMIS education and training.
- Receive WHMIS education and training.
## Participant Activity

Using the sample label, locate each label element and then connect it to the correct description.

</table>

There are several products in your workplace that have the flame pictogram. Rank the hazard represented by each product based on the pictogram, signal word and hazard statement:

1. Flame. Warning. Flammable liquid and vapour
3. Flame. Danger. Extremely flammable liquid and vapour
Participant Activity: Answers

Using the sample label, locate each label element and then connect it to the correct description.

Product K1 / Produit K1

Product Identifier

Pictogram

Signal word

Danger

Hazard statement(s)

Fatally if swallowed.

Causes skin irritation.

Precautions:

Wear protective gloves.

Wash hands thoroughly after handling.

Do not eat, drink or smoke when using this product.

Store locked up.

Dispose of contents/container in accordance with local regulations.

IF ON SKIN: Wash with plenty of water.

If pain or irritation occurs: Get medical advice or attention.

Take off contaminated clothing and wash if before reuse.

IF SWALLOWED: Immediately call a Poison Centre or doctor.

Rinse mouth.

Risk group identifier

Initial supplier identifier

ABC Chemical Co., 123 Anywhere St., Mytown, ON N0N 0N0 (123) 456-7890

There are several products in your workplace that have the flame pictogram. Rank the hazard represented by each product based on the pictogram, signal word and hazard statement:

3. Flame. Warning. Flammable liquid and vapour

1. Flame. Danger. Extremely flammable liquid and vapour

C) Why learn about SDSs?

The Workplace Hazardous Materials Information System, or WHMIS, requires suppliers to provide their customers with information about the hazards and safe use of their products. The SDS is the main source of this information.

Your employer will receive these SDSs when they purchase the hazardous products.

Stop and think! Do you know about the hazards of the products that you are currently working with? Why is this information important?

IMPORTANT: To complete your WHMIS instruction, your employer must also provide education and training on the hazards and safe work practices for WHMIS products used at your workplace.

Products

WHMIS establishes rules for classifying products into hazard classes and categories. Suppliers must attach labels and provide SDSs for those products that meet one or more of the classification criteria according to the Hazardous Products Act and regulations.

When a product meets one or more of the classification criteria, it is known as a hazardous product.

Safety Data Sheets (SDSs)

Instructor tip:

A sample SDS is provided but ideally the participants should use an SDS from a product they use in their workplace. You may wish to modify the questions to suit the workplace as well.

The SDS

The SDSs are produced by the supplier of the product and provide more detailed information about the product. They are an important resource for workplaces and workers. Employers and workers use the information on the SDS to protect themselves from hazards, and for safe handling and emergency measures.

In Canada, the GHS formatted SDS replaces the Material Safety Data Sheets (MSDSs) used under WHMIS. The SDS has a standard 16-section format with specific information requirements.

Some important points to note about the SDS:

- The SDS has 16 sections and will typically be anywhere from 2-10 pages in length.
- There is a set format for the SDS. The information must always be in the same section, regardless of which supplier created the SDS.
- SDSs must be readily available to everyone in the workplace. SDSs may be stored in a binder or they may be stored electronically on a computer. Employers must train employees on how to understand the SDS as well as how/where to access the SDSs at the workplace.
- In Canada, the SDS (and label) must be updated when significant new data becomes available.

A new requirement is that the WHMIS 2015 classification must appear in section 2 of the SDS, along with the required label elements. Let’s take a quick look at the sections and type of information that is available on the SDS.
<table>

</tr>
</tbody>
</table>

* The supplier that must be identified on an SDS is the initial supplier identifier (i.e., the name, address and telephone number of either the Canadian manufacturer or the Canadian importer). There are two exceptions to this requirement. In a situation where a hazardous product is being sold by a distributor, the distributor may replace the name, address and telephone number of the initial supplier with their own contact information. In a situation where an importer imports a hazardous product for use in their own work place in Canada (i.e., the importer is not selling the hazardous product), the importer may retain the name, address and telephone number of the foreign supplier on the SDS instead of replacing it with their own contact information.

**These impurities and stabilizing products are those that are classified in a health hazard class and contribute to the classification of the material or substance.

***Each ingredient in the mixture must be listed when it is classified in a health hazard class and is present above the concentration limit that is designated for the hazard class in which it is classified or is present in the mixture at a concentration that results in the mixture being classified in any health hazard class.

****Sections 12 to 15 require the headings to be present, but under Canadian regulations, the supplier has the option to not provide information in these sections.
Who uses SDSs?

SDSs are used by a wide range of people including safety professionals, engineers, emergency responders, and doctors.

Some sections of the SDS can be technical to read. If you do not understand the information, ask for help. Ask your supervisor, a health and safety professional, health and safety committee or representative, union, or a medical professional.

How to Read and Use the SDS – A Worker’s Guide

The SDS provides the user with lots of information. It is not meant to be overwhelming. Remember that the main focus is to help you learn about:

- The hazards of the product (e.g., hazard pictograms, signal words, hazard statements)
- How to work safely with the product (in more detail than the label provides)
- First-aid measures
- Emergency measures

Where do you find this information on the SDS? Fortunately, the standardized format means that once you become familiar with the content for each section of the SDS, you know where to look regardless of which supplier wrote the SDS.

You can think of the SDS as having four main purposes. It provides information on:

a) Identification: for the product and supplier
b) Hazards: health, physical (fire and reactivity), and environmental if provided.
c) Prevention: steps you can take to work safely, and reduce or prevent exposure or an emergency.
d) Response: appropriate responses in various situations (e.g., first-aid, fire, accidental release)

Let’s look at Table 4 again and identify which sections provide the information for these four purposes.

a. Identification:
- Section 1 contains the product and supplier identification information. Confirm that you are reading the SDS that matches your product by comparing the product name, the supplier, and other identifiers.
- Section 3 confirms the ingredient identity, where required, and indicates if there are any trade secrets.

b. Hazards:
- Section 2 summarizes the hazards of the product (e.g., hazard class or category). It will also show the label elements. It may list other hazards which did not result in classification, but of which you should be aware.

c. Prevention:
- Section 7 outlines storage and handling precautions when you are working with the product.
- Section 8 lists protection measures such as personal protective equipment, and exposure guidelines.
- Section 13 may list safe handling for waste and disposal advice.
d. Response:
- Section 4 provides first-aid and treatment information in the event of exposure.
- Section 5 outlines steps to take in the event of a fire
- Section 6 gives precautions during accidental release or spills

These sections provide more detailed information that ‘backs up’ and adds to the hazard identification information given in Section 2:

- Section 9 lists the physical and chemical properties
- Section 10 outlines stability and reactivity data
- Section 11 provides more details about the health hazards (its toxicity).
- Section 12 may list any information about potential effects on the environment.

The remaining sections provide information on other laws that apply to the product or its ingredients and information about the SDS (e.g., who wrote it):

- Section 14 provides information about the product’s hazards during transport. (not mandatory)
- Section 15 may list other laws that apply. (not mandatory)
- Section 16 will have other information such as the date the SDS was written, who wrote it, and references.

Always carefully read the SDSs for the products that you use. If you are unsure or unclear about what it means, talk to your supervisor before handling the product.

A few things to note:

- Make sure that the product is being used in the intended manner; otherwise the advice provided on the SDS and label may not apply, or the protective measures listed may not be adequate. Section 1 of the SDS should describe the typical use of the product and may indicate restrictions. Ask your supervisor or a health and safety professional for advice if the way you use the product does not match the SDS.
- Section 2 will summarize the hazards related to the product, precautions to take, and what to do in an emergency. Understand that the SDS covers information about the potential hazards, but may not be specific about the required safe work procedures needed for your workplace (e.g., the SDS may not specify what type of respirator must be used, just that one is needed). More information can be found in chemical management or chemical safety publications. These decisions may require the help of a safety professional or someone with chemical safety knowledge.

Hazard analysis

Hazard analysis is the systematic examination of identifying potential loss exposure. This approach is critical in knowing what hazards exist at the workplace and what we can do to eliminate or reduce the risk from those hazards.

An important step in the hazard analysis process is developing appropriate procedures or practices that controls hazards so workers do not become injured or ill.
Here is a simple hazard analysis approach:

- Inventory tasks performed at the workplace.
- Identify the hazards for each task and then assess the risk for each task (preferable).
- Develop a plan to eliminate the hazard or a plan to reduce the risk of each hazard. Create guidelines, procedures or practices with safety built right in and communicate through orientation or training for each guideline, procedure or practice.
- Implement and follow-up to ensure everything is working as it should be.

Worker involvement in this entire process is key to getting it correct from start. Workers also can become a big part in the communication, implementation and follow-up.

As a first step in hazard control, determine if the hazards may be controlled at its source (where the problem is created) by eliminating the hazard. If this does not work, try to put controls between the source and the worker. **The closer a control is to the source of the hazard, the better the hazard can be controlled.** If this is not possible, hazards must be controlled along the path – that is, between the source and the worker. As a last resort, the hazards must be controlled at the worker level. Hazards which are controlled at the worker level are highly dependent upon the individual worker, i.e. ill-fitting PPE or PPE that is worn correctly or not at all or a procedure which is read but not comprehended.

When considering hazards control, recognize more than one control may be needed in order to reduce the risk of the hazard harming a person, i.e. when welding, adequate ventilation is a control for welding fumes as well as a welding shield and PPE to protect from sparks.

**Hierarchy of hazard control**

1. **Elimination** – First, try eliminating the hazard. Getting rid of a hazardous product, substance, tool or process is the best way to protect workers.
2. **Substitution** – If elimination is not practical, try replacing a hazardous substance or process with one less dangerous. For example, a hazardous chemical can be replaced with a less hazardous one, i.e. substituting bleach with a diluted vinegar/water solution.
3. **Engineering/design** – This control involves redesign, isolation or automation to reduce the risk of exposure to a hazard. Some examples of engineering include: improving the ventilation, creating a separate room to perform a dangerous task, or using a machine to do a job that would be hazardous for a person to do.
4. **Administrative** – If the above controls are not practicable, administrative controls may be implemented. These include training, improving work practices and procedures, new policies, scheduling, planning or variety of other managerial concerns that change how a job is done.
5. **Personal Protective Equipment (PPE)** – Finally, if all other control strategies fail to meet the safety needs for a particular task, PPE may be implemented. Although this control is a last resort, there are some activities where a job cannot be performed without the use of PPE, i.e. welding, rescue. The key is not to jump through the hierarchy of controls without carefully evaluating each option.
**PARTICIPANT ACTIVITY: Finding Your Way Around an SDS**

Let’s go through an SDS and learn where to look for information. Using the SDS in Appendix B or an SDS provided by your trainer, go through the questions listed with the class, record the answers and include the section where that information was found.

D) Hazard Classes/Categories

Review of Hazard Classification

As mentioned earlier, there are two main hazard groups: physical and health. Within each of these groups are classes of hazards and within each class, there are categories. The class defines the nature of the hazard (e.g., flammable), while the category defines the severity of the hazard (e.g., very flammable).

<table>
<thead>
<tr>
<th>Hazard Group</th>
<th>Hazard Class</th>
<th>Hazard Category</th>
</tr>
</thead>
</table>

Determining the hazard class or category is the responsibility of the manufacturer or supplier of a product.

Employers should review the information provided on the labels and the safety data sheet. From this information, and other chemical safety information sources, employers are required to make sure the right handling, storage and control steps are in place to prevent or reduce hazards. Employers must make sure that workers know about these steps, and that workers have had the appropriate training in safe work and storage procedures for each product used in the workplace.

Workers have the responsibility to follow the safe work and storage procedures that they have been trained for.

Working with Multi-hazard Products

It is not uncommon for a product to have characteristics that fall into more than one hazard class. For example, acetone can be classified into multiple classes, including:

- flammable liquids
- serious eye damage/eye irritation
- specific target organ toxicity – single exposure

Regardless of how many classes are listed for a product, you approach using it in the same way: make sure that you review the SDS and label to be aware of all potential hazards. The SDS and label will provide guidance on the appropriate handling, storage, controls and so on that will be required.

There are precedence guidelines that suppliers may use that determine how information should be presented to users when multiple hazards are present. The rules of precedence try to reduce confusion by having two (or more) “competing” or repetitive messages. Only the most protective wording is used in these situations. For example, you will not see a label with both of the signal words “Danger” and “Warning” on it. It will use “Danger”. Once you read the rest of the label and the SDS, you will understand the full message.

Also, some hazards associated with a product may not use a pictogram.
Participant Activity

Review Questions

True or False  The rules of precedence for information on a label means that sometimes a product’s label will have less protective wording.

True or False  It is important to consider other health and safety hazards beyond the hazard pictogram or hazard class/category.

True or False  If a product has significant physical hazards such as being corrosive or flammable and steps are taken to control it, then workers do not need to be concerned about adverse health effects.
Participant Activity: Answers

True or False The rules of precedence for information on a label means that sometimes a product’s label will have less protective wording.

(Answer: The rules of precedence avoid confusing things like “Danger” and “Warning” on the same label. It always provides the higher level of hazard information to be more protective.)

True or False It is important to consider other health and safety hazards beyond the hazard pictogram or hazard class/category.

(Answer: Many products have other general safety hazards that are not covered by WHMIS. Example - Flammable products may be an increased risk in confined spaces.)

True or False If a product has significant physical hazards such as being corrosive or flammable and steps are taken to control it, then workers do not need to be concerned about adverse health effects.

(Answer: Many products can have both physical and health hazards. Some flammable products are toxic at far lower airborne levels than that those required for a fire. The label and SDS will inform the users of all of the hazards.)
5. Hazard Review

In this section, we will take a more detailed look at the hazard classes and provide some useful tips for working with products in the various hazard classes. The hazard information will be summarized and presented in two ways.

- The **Hazards by Pictogram Summary** groups similar classes/hazards primarily by the hazard pictogram. For each of the ten hazard pictograms, the classes/categories that use that pictogram will be listed. Information covers topics such as recognizing the hazard and key handling and storage measures.

- The **Hazard Class Summary** discusses each hazard class and outlines the hazard categories within each class. In addition, the hazard pictogram(s), signal words and hazard statements are included for each class. Key precautions are summarized for each class.

**Instructor Tip:**
The instructor manual contains summaries of all hazard classes. The participant workbook contains 9 common hazard classes: flammable aerosols, gases under pressure, flammable liquids, oxidizing liquids, corrosive to metals, acute toxicity, skin corrosion/irritation, serious eye damage/eye irritation and carcinogenicity.

If your participants require additional hazard class summaries than what is provided in the participant workbook, make copies for the participants from this book.

**Instructor Tip:**
You can decide which way you would prefer to present the following information:

You may find it helpful to use the **Hazards by Pictogram Summary** for a general overview of the hazards, and tips for working safely with particular types of hazards.

And/or

You may prefer using the **Hazard Class Summary**, particularly if the number of hazard classes used in the workplace is small.

**Prepare in advance and know your group.** Don’t spend a lot of time going through each and every hazard class if it is not necessary for that specific workplace.

Education and training for some of these hazard classes may be beyond the scope of this course. Employers must provide worksite specific training.
Hazards by Pictogram Summary

Classes using the same hazard pictograms are grouped together to help general understanding. Note that the classes, for example, Combustible dusts and Simple asphyxiants that do not require the use of a pictogram. Physical hazards not otherwise classified, and Health hazards not otherwise classified require the use of a pictogram that is representative of the hazard present.

** The Explosive hazard class and the Environmental classes have not currently been adopted by WHMIS.
Exploding bomb Pictogram

Because of the high risk of significant personal injury and extensive property damage for incidents involving these products, proper training and appreciation of the hazards is essential.

Products with this pictogram should only be used by individuals who are thoroughly trained and aware of the hazards and how to control them. This level of training is beyond the scope of this Kit.

What hazard classes use this pictogram?

While the explosive class has not been currently adopted by WHMIS, you may see the class identified. The hazard categories address explosives in terms of unstable explosives; mass explosion hazard; severe projection hazard; fire, blast or projection hazard and may explode in fire.

Note that two other hazard classes use the explosive hazard pictogram.

- The first two categories of self-reactive substances and mixtures (Type A and B) (e.g., most hazardous) will use this pictogram. Self-reactive substances are sensitive to temperature and temperature changes. The hazard with these products is that heating (even slight heating), such as may occur through improper handling or storage conditions, may cause an explosion (Type A) or a fire/explosion (Type B). Handling, storage and control measures for these will be discussed in the section for the self-reactive substances class.

- The other hazard class is organic peroxides. The first two categories under organic peroxides (Type A and B) (e.g., most hazardous) are an explosion (Type A) or a fire/explosion hazard (Type B) if heated. Organic peroxides are highly reactive and tend to ignite easily and burn rapidly. Organic peroxides are very unstable and are generally sensitive to light (e.g., have to be stored in darkness). Some are sensitive to temperature changes or friction (e.g., shaking or bumping a container that holds organic peroxide material). Organic peroxides tend to react explosively with metals. Handling, storage and control measures for these will be discussed under the organic peroxides hazard class.
Flame Pictogram

What are Flammable hazards?
Flammable hazards are products that can ignite easily and burn rapidly. For a fire to occur, three elements must be together at the same time and in the right proportions: fuel, oxygen, and heat (e.g., an ignition source such as a spark). It is very important for fire prevention and when working safely with flammable products to make sure that these three elements are not present together in the right amounts at any time.

For example, vapours from a flammable liquid can mix with air and be exposed to the right amount of heat to ignite and burn. In the workplace, controlling the fuel (e.g., flammable products), keeping quantities low, and eliminating sources of ignition are the main ways that allow flammable products to be handled safely.

What hazard classes use the flame pictogram?
In most workplaces, you will see this pictogram used for the following hazard classes:

- Flammable gases
- Flammable aerosols
- Flammable liquids
- Flammable solids

There are other hazard classes that use the flammable hazard pictogram but these products are rarely used.

- Pyrophoric liquids - these products react with air to cause a fire
- Pyrophoric solids – these products react with air to cause a fire
- Pyrophoric gases – these products react with air to cause a fire
- Self-heating substances and mixtures (e.g., spontaneous combustion) - these products react with air, can self-heat and catch fire (no ignition source required)
- Substances and mixtures which, in contact with water, emit flammable gases - these products react with water and release flammable gases
- Self-reactive substances and mixtures* - these products can react strongly to conditions such as shock, pressure, temperature, light, or contact with another product
- Organic peroxides* - very unstable and reactive products

* Note that the most hazardous categories (Types A, B) within these classes will use the explosion pictogram alone or with the flammable pictogram

Are there other hazards associated with flammable materials?
Fire and explosion are the main concerns, but other issues may be present. If a product is classified as flammable, the supervisor and workers must understand specifics of what the hazards are and how to use it safely.
Other concerns with flammable hazards include:

- **Health hazards** – Flammable products can be a health hazard (e.g., toxic, corrosive, irritant, etc.) at air concentrations well below the levels needed to be a fire hazard.

- **Accumulation of static charge** – Static electricity is the electric charge generated when there is friction between two things made of different materials or substances. This charge can occur when flammable liquids are poured, pumped, filtered, agitated, stirred or flow through pipes these actions can act as an ignition source. The release of the charge can ignite flammable products.

- **Asphyxiation** - The vapours from flammable liquids are usually heavier than air and will accumulate near the ground. These heavy vapours can displace the air in a space (take the place of air or oxygen), and become an asphyxiation (suffocation) hazard.

- **Toxic by-products from burning** - When flammable products burn, toxic gases and vapours are produced such as carbon monoxide, hydrogen cyanide and nitrogen oxides.

- **Flashback** - Since the vapour of most flammable liquids is heavier than air, the vapours can spread a considerable distance along the ground or floor and be ignited by a distant spark or flame or source of heat. Once vapours from a flammable liquid have ignited, the flames may “flash-back”, meaning that the flames travel back to the container or source of the flammable liquid and an explosion or fire can result.

- **Hot work** - Working with ignition sources near flammable products is known as “hot work.” Welding and cutting are examples.

### Key Handling Information for Flammable Products

- Check the label and SDS for information about the hazards and the necessary precautions for the flammable product you are using.

- Minimize the risk of fire/explosion by preventing the release of flammable products into the air.

- Use flammable products only in well-ventilated areas.

- Use the smallest amount of flammable product necessary for the job.

- Eliminate ignition sources and combustible materials from the area where flammable products are used (e.g., including oily rags, cardboard boxes). Make sure that there is no smoking, hot work, or hidden sources of ignition (e.g., pilot lights in a furnace or hot water tank). Dispose of combustible material appropriately (e.g., oily rags are in approved containers).

- Do not heat containers or cylinders containing flammable products.

- In some cases, non-sparking ventilation systems and equipment (such as non-sparking tools) may be necessary.

- Ground and bond containers or cylinders during transfer operations to prevent buildup of static charge. Be sure that you understand how to do this properly.

- Use equipment designed for flammable storage – e.g., flammable storage fridge, flammable cabinets, or flammable safety cans.

- Be aware of incompatible products such as oxidizers and avoid contact. Check the SDS for specific information and recommendations.

- Be aware of conditions to avoid with the flammable product being used. Some products using this hazard pictogram may be reactive to air or water; others may be sensitive to temperature, pressure, friction, sunlight.
• Avoid spilling product and contaminating your skin or clothing.
• Keep work areas clean and tidy. Wipe up spills and keep surfaces clean to prevent contact with skin or incompatibles. Prevent accumulation of dust or other residues on ledges or other surfaces.
• Do not smoke, eat or drink in work areas. Wash hands thoroughly after handling. Wash hands before eating, drinking, smoking or going to the toilet.
• Remove contaminated clothing and leather shoes or boots since they can be a severe fire hazard. Wash contaminated items, where appropriate, immediately and thoroughly in water before re-wearing or discarding.
• Understand and practice emergency procedures so that you know what to do if it becomes necessary to act:
  – Make sure that appropriate fire extinguishers are available.
  – Be aware of at least two different exit paths in the event of fire.
  – Make sure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  – Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, non-sparking tools, etc.). Avoid using combustible materials (such as paper towels or sawdust) to clean up or absorb spills.
• If personal protective equipment (PPE) is required, the employer must make sure that workers are thoroughly trained in its selection, fit, use and maintenance. Refer to the SDS for guidance on selection.

**Key Storage Information for Flammable Products**

• Keep away from incompatible materials. Check SDS for incompatibles.
• Use equipment designed for flammable storage – e.g., flammable storage fridge, flammable cabinets, or flammable safety cans.
• Always keep the lids on containers holding flammable products to prevent the release of vapours.
• Store in a cool, dry, well-ventilated area, away from direct sunlight and exit paths. Post warning signs.
• Keep away from potential ignition sources such as heat, sparks or open flames. No smoking near flammable storage.
• Avoid storing large quantities if possible.
• Inspect containers and storage area regularly for signs of leakage or damage. Contain spills or leaks by storing in trays made from compatible materials.
• Ensure that appropriate firefighting and spill cleanup equipment is readily available.
• Avoid storing flammable products in basements. Ground floor storage is preferred as it provides easier access for emergency situations.
• Follow by-laws and regulations such as Fire Codes and health and safety regulations that apply to the workplace in your jurisdiction.
Flame over circle Pictogram

What are Oxidizing Hazards?

The pictogram for oxidizing products is an “○” with flames on top of it. The “○” is for oxygen and the flames show that oxidizers are significant fire hazard if they are not handled properly. There are three types of oxidizing product: oxidizing gases, oxidizing liquids and oxidizing solids.

The basic components for a fire are a source of fuel (such as combustibles), a source of oxygen, and a spark or source of ignition.

With most fires, the source of oxygen comes from the air (air has about 21% oxygen). With oxidizers, these products readily give off oxygen or other oxidizing substances (such as bromine, chlorine, or fluorine) and this is a significant fire/explosion risk. Oxidizers do not burn by themselves but oxidizers can:

• greatly increase the development of a fire and make it more intense (burns hotter and faster than the fire would under “normal” fire conditions),
• cause substances that do not normally burn in air to burn rapidly,
• cause some combustible materials to burn spontaneously without the presence of obvious ignition sources such as a spark or flame.

Examples include:

• oxidizing gases: oxygen, ozone
• oxidizing liquids: nitric acid, perchloric acid
• oxidizing solids: potassium permanganate, sodium chlorite.

What hazard classes use the flame over circle pictogram?

The oxidizer hazard pictogram is used for three different oxidizer hazard classes:

• Oxidizing liquids
• Oxidizing solids
• Oxidizing gases

Although the three classes of oxidizer may have different physical states, they share the characteristics of oxidizers and they all pose fire hazards if appropriate handling and storage needs are not followed.

Are there other potential hazards associated with oxidizers?

The primary hazard of oxidizing products is fire and explosion. In addition to property damage, if an oxidizer product contaminates the skin or clothing, there is a high risk of very significant personal injury in the event of a fire.

Other concerns with oxidizing hazards include:

• Health hazards - Oxidizing products can have other hazardous properties as well so carefully read the label and SDS for other potential hazards (e.g., health, corrosivity, reactivity).
• Incompatible materials - Oxidizers are very reactive. NEVER return unused product to the original container, even if it does not appear to be contaminated.
Key Handling Information for Oxidizers

- Check the label and SDS for information about the hazards and necessary precautions for the oxidizing product you are using.
- Eliminate ignition sources and combustible materials. Promptly remove combustible wastes, including wood, paper and rags, from work areas. Ensure that there is no smoking.
- Keep away from incompatible materials - particularly greases, lubricants, cleaning solvents, paints, or thinners.
- Keep valves and fittings free from oil and grease.
- Use only in well-ventilated areas.
- Keep containers tightly closed when not in use.
- Avoid spilling product and contaminating your skin or clothing. Immediately report leaks, spills or failures of the safety equipment (e.g., ventilation system). In the event of a spill or leak, exit the area immediately.
- Keep work areas clean and tidy. Wipe up spills and keep surfaces clean to prevent contact with skin or incompatibles. Prevent accumulation of dust or other residues on ledges or other surfaces.
- Do not smoke, eat or drink in work areas. Wash hands thoroughly after handling. Wash hands before eating, drinking, smoking or going to the toilet.
- Remove contaminated clothing and leather shoes or boots since they can be a severe fire hazard. Wash contaminated items, where applicable, immediately and thoroughly in water before re-wearing or discarding.
- Maintenance personnel need to know the hazards and any special procedures and precautions needed before work begins.
- Be very cautious about mixing oxidizers with water. Follow the chemical supplier’s directions. Some oxidizers will generate large amounts of heat when they are mixed with water.
- Never return unused product to the original container.
- Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  - Ensure that appropriate fire extinguishers are available.
  - Be aware of at least two different exit paths in the event of fire.
  - Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly. Follow first aid instructions listed on the SDS or label.
  - Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, non-sparking tools, etc.). Avoid using combustible or reactive materials (such as paper towels or sawdust) to clean up or absorb spills.
- If personal protective equipment (PPE) is required, the employer must ensure that workers are thoroughly trained in its selection, fit, use and maintenance. Refer to the SDS for guidance on selection.
- Fire resistant or flame retardant clothing may be required.
Key Storage Information for Oxidizers

- Keep away from incompatible materials. Check SDS for incompatibles.
- Store in a cool, dry, well-ventilated area and away from direct sunlight and exit paths. Post warning signs. Be aware of any other special storage conditions.
- Keep away from potential ignition sources such as heat, sparks or open flames. No smoking near the oxidizer storage area.
- Avoid storing large quantities if possible.
- Inspect containers and storage area regularly for signs of leakage or damage. Contain spills or leaks by storing in trays made from compatible materials.
- Store in containers that the supplier recommends. Normally these are the same containers in which the product was shipped.
- Empty containers may contain hazardous residue. Store separately. Keep closed.
- Do not use wooden pallets or other combustible pallets for storing containers of oxidizing products. Walls, floors, shelving, and fittings in storage areas should be constructed of non-combustible materials.
- Ensure that appropriate firefighting and spill cleanup equipment is readily available.
- Follow by-laws and regulations such as Fire Codes and health and safety regulations that apply to the workplace in your jurisdiction, including the disposal of empty containers.
Gas cylinder Pictogram

What are gases under pressure?
Thousands of products are available which contain gases and mixtures of gases that are stored under pressure in cylinders.

There are four different hazard categories of gases under pressure:

- compressed gas,
- liquefied gas,
- refrigerated liquefied gas, and
- dissolved gas.

Compressed gas (Non-liquefied gas):
Non-liquefied gases are also known as compressed, pressurized or permanent gases. These gases do not become liquid when they are compressed at normal temperatures, even at very high pressures. Examples are oxygen, and nitrogen.

Liquefied gas and Refrigerated liquefied gas:
Liquefied gases are gases which can become liquids at normal temperatures when they are inside cylinders under pressure. Refrigerated liquefied gases are those gases that are made partially liquid because of its low temperature. Initially the cylinder is almost full of liquid, and gas fills the space above the liquid. As gas is removed from the cylinder, enough liquid evaporates to replace it, keeping the pressure in the cylinder constant. Examples: anhydrous ammonia, chlorine, propane, nitrous oxide and carbon dioxide

Dissolved gas:
Acetylene is the only commonly used dissolved gas. Acetylene is chemically very unstable and at atmospheric pressure, acetylene gas can explode. However, acetylene is routinely stored and used safely in cylinders because the acetylene cylinders are packed with an inert, porous filler. The filler is saturated with acetone or other suitable solvent. When acetylene gas is added to the cylinder, the gas dissolves in the acetone to create a stable solution.

What Hazard Classes Use this Pictogram?
Only Gases under pressure use this pictogram.
Are there other potential hazards associated with Gases under pressure?

There are many other hazards associated with Gases under pressure.

- **Health** - Many gases under pressure have other properties such as being toxic, flammable, corrosive or reactive. If these properties meet the criteria for other classes, they will also use the hazard pictogram for that class (e.g., flammable gas).

- All compressed gases are hazardous because of the **high pressure** inside the cylinder. Gas can be released deliberately by opening the cylinder valve, or accidentally from a broken or leaking valve. Even at a low pressure, gas can flow rapidly from an open or leaking cylinder. Damaged cylinders can rocket or spin out of control causing significant injury and damage. This type of incident is often caused when an uncapped or unsecured cylinder has been knocked over, breaking the cylinder valve.

- **Asphyxiation (suffocation)** - Inert gases such as argon, helium, neon and nitrogen are not toxic and do not burn or explode but they can cause injury or death by asphyxiation if they displace the oxygen in a space. For example, a litre of liquid nitrogen forms 700 litres of nitrogen gas at room temperature.

- **Frostbite** - Gases escaping from a cylinder may be very cold and cause frostbite. Severe frostbite can lead to serious permanent damage to unprotected skin or eyes. Some gases may be labelled as cryogenic which means the escaping gas is capable of causing frostbite.

**Key Handling Information for Gases under pressure**

- Understand all of the hazards associated with the product, and how to use it safely. Consult the Safety Data Sheet (SDS) for information about the hazards and necessary precautions for the gas you are using.

- Prevent the release of gas into the workplace. Use compressed gases only in well-ventilated areas. Close all valves when cylinders are not in use.

- Use the smallest practical cylinder size for a particular job.

- Keep away from flames and heat sources. No smoking.

- Inspect all cylinders and valves for damage and proper labels. Make sure cylinders are not giving off odours or making hissing sounds. Never open a damaged valve.

- Secure cylinders to a wall or rack in an upright position. Leave the cylinder cap in place until the cylinder is secured and ready for use.

- Use the appropriate regulator. Make sure that equipment is compatible with cylinder pressure and contents. Do not use homemade adaptors or force connections between cylinder valve and gas handling equipment. Never tamper with safety devices in cylinders, valves or equipment.

- Do not apply any lubricant, jointing compound or tape to cylinder valves, fittings or regulator threads. Keep dirt, rust, oil or grease away from all cylinders or fittings.

- Do not drop or bang cylinders against each other. Move cylinders using a hand truck or cart designed for the purpose.

- Maintenance personnel must be aware of the possible hazards and any special procedures and precautions before they begin to work.
• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – Ensure that appropriate fire extinguishers are available. Be aware of at least two different exit paths in the event of fire.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.

• Avoid direct skin contact with extremely cold liquids or compressed gases escaping from the cylinder. Never wear watches, rings or bracelets because they can freeze to exposed skin if splashed by a cold gas. When using gases that are harmful by skin contact (e.g., frostbite), wear protective gloves, aprons or other clothing depending on the risk of skin contact.

• Always wear eye protection when working with gases under pressure. Wear chemical safety goggles – safety glasses may not provide enough protection. In some cases, a faceshield will also be necessary.

• If personal protective equipment (PPE) is required, the employer must ensure that workers are thoroughly trained in its selection, fit, use and maintenance. Refer to the SDS for guidance on selection.

**Key Storage Information for Gases Under Pressure**

• Store compressed gas cylinders in cool, dry, well-ventilated areas, away from incompatible materials and ignition sources. Ensure that the storage temperature does not exceed 52°C (125°F). No smoking. Keep away from exits. Post warning signs.

• Store compressed gas cylinders in the upright position and securely fastened in place with cylinder valve protection cap in place.

• Avoid storing large quantities if possible. Do not keep cylinders longer than the supplier recommends.

• Properly and promptly dispose of “empty” or unlabelled cylinders.

• Ensure that appropriate firefighting equipment is readily available.

• Follow by-laws and regulations such as Fire Codes and health and safety regulations that apply to the workplace in your jurisdiction.
Corrosion Pictogram

What are corrosive products?
Any product that can chemically damage or destroy steel or aluminum is considered “corrosive to metals”.

This pictogram is also used to indicate two health hazard classes for products that can cause destructive, irreversible damage to the skin and eyes. The two hazard classes are:

- Skin corrosion/irritation - Skin corrosion (Cat. 1, 1A, 1B and 1C)
- Serious eye damage/eye irritation - Serious eye damage (Cat. 1)

Corrosive products such as strong acids and strong bases can attack (corrode) metal or our skin/eyes. Common acids include hydrochloric acid, nitric acid and sulfuric acid. Common bases are sodium hydroxide (caustic soda) and ammonia. Check the labels and read the SDS (Section 10: Stability and reactivity) for additional information.

What hazard classes use this pictogram?
This pictogram is used by the ‘corrosive to metals’ hazard class (physical hazard group) to indicate products that can cause corrosion or damage to metal containers and structures upon contact.

This pictogram is also used by two health hazard classes for products that can cause destructive, irreversible damage to the skin and/or eyes.

This pictogram indicates that the damage caused by exposure to the corrosive material is very significant and likely irreversible. Lower hazard categories (e.g., skin or eye damage that will heal/be reversible) for the two health classes will use the exclamation mark hazard pictogram or no pictogram in some cases.

Are there other potential hazards associated with corrosive products?
- Containers can become weak and eventually leak or collapse, spilling the contents into the workplace. Corrosives can also damage metal equipment and building components which may lead to injuries and collapse of structures.
- Many corrosive products, both liquid and solid, generate large amounts of heat when they are mixed with water. For example, a glass of water thrown into a bucket of concentrated sulfuric acid is converted instantly to steam which will eject the entire contents of the bucket into the air. If the corrosive requires dilution with water, always add the corrosive to water (do NOT add water to a corrosive), slowly, in small amounts, with frequent stirring. Always use cold water.
- Corrosive products often have additional hazards such as reactivity, flammability, and toxicity.
- Corrosives are incompatible with many other chemicals and may result in toxic or explosive products if they contact each other. The SDS for a corrosive will explain which metals or other products, such as plastics or wood, it will attack (check Section 10: Stability and reactivity). Pay attention to using the proper containers.
Key Handling Information for Corrosives

- Understand all of the hazards associated with the product and how to use it safely. Consult the SDS for information about the hazards and necessary precautions for the corrosive product you are using.

- Inspect containers of corrosive product for damage or leaks before handling.

- Do not add water to corrosive product because this can cause a violent reaction. If it is absolutely necessary to mix a corrosive with water, do so slowly adding the corrosive to cold water, in small amounts, and stir frequently.

- Prevent the release of corrosive product (dust, mist, gas or vapour) into the workplace.

- Use corrosive product only in well-ventilated areas. Use the smallest amount necessary.

- Dispense corrosives carefully and keep containers closed when not in use. Use corrosion-resistant equipment such as pumps, scoops or shovels.

- Use only the types of resistant containers recommended by the manufacturer or supplier.

- Move containers of corrosive product with caution. Move large drums using drum cradles. Carboy caddies and safety bottle carriers are available for smaller, common container sizes.

- Avoid direct contact with corrosive product. Clean up any spills and buildups of corrosives promptly and safely. Immediately report leaks, spills or failures of the safety equipment (e.g., ventilation system). In the event of a spill or leak, exit the area immediately.

- Do not smoke, drink, chew gum or eat in areas where these products are used. Wash hands before eating, drinking, smoking or going to the toilet. Avoid touching your skin with contaminated hands. Clean your skin thoroughly at the end of the workday. Remove and clean contaminated clothing before wearing it again, or discard it.

- Do not reuse empty containers - hazardous corrosive residue could remain inside.

- Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  - Ensure that eyewash and emergency shower are readily available in the immediate work area and know how to use them. These devices must be tested regularly.
  - Flush contaminated eyes or skin with water for at least 20-30 minutes, sometimes longer, in case of accidental contact. Call immediately for emergency medical assistance.
  - Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, non-sparking tools, etc.). Avoid using combustible or reactive materials (such as paper towels or sawdust) to clean up or absorb spills.
  - Ensure that appropriate fire extinguishers are available. Be aware of at least two different exit paths in the event of fire.

- Wear the appropriate personal protective equipment (PPE) as specified by your employer for the job. This equipment may include respiratory protection, goggles, face shield and chemical protective clothing like an apron and gloves made from corrosion resistant material.

- If personal protective equipment is required, the employer must ensure that workers are thoroughly trained in its selection, fit, use and maintenance. Refer to the SDS for guidance on selection.
Key Storage Information for Corrosives

- Inspect containers and storage area regularly for signs of leakage or damage. Store in the original, labelled, shipping container.

- Store containers at a convenient height for handling, below eye level if possible. High shelving increases the risk of dropping containers and the severity of damage, injury and/or exposure if a fall occurs.

- Keep the amount of these products in storage as small as possible.

- It is good practice to use a “first in/first out” policy and to mark the date that the container was received and the date it was first opened.

- Store in containers that the chemical supplier recommends (usually the same container in which the material was shipped).

- Store away from incompatible materials and in a cool, dry, well-ventilated area and out of direct sunlight. Store corrosive on plastic trays. Keep away from incompatible materials. Check the SDS for specific information. Post warning signs.

- Use proper corrosive storage cabinets for large quantities of corrosive products. These units have corrosion-resistant interiors and hardware (e.g., door hinges and shelf brackets). Flammable storage cabinets are NOT corrosion-resistant.

- Ensure that appropriate firefighting and spill cleanup equipment is readily available.

- Empty containers may contain hazardous residue. Store separately. Keep closed.

- Follow by-laws and regulations such as Fire Codes and health and safety regulations that apply to the workplace in your jurisdiction.
Skull and crossbones Pictogram

**What is acute toxicity?**

These products are fatal, toxic or harmful if inhaled, following skin contact, or if swallowed.

Acute toxicity refers to effects occurring following skin contact or ingestion exposure to a single dose, or multiple doses given within 24 hours, or an inhalation exposure of 4 hours.

Acute toxicity could result from exposure to the product itself, or to a product that, upon contact with water, releases a gaseous substance that is able to cause acute toxicity.

---

**Toxicity of a chemical does not change, but the risk of exposure from using it can be controlled and minimized through proper handling and storage practices.**

For example: A highly toxic chemical can have a low health hazard if it is used with proper precautions and care. On the other hand, it is possible that a chemical of low toxicity may present a high health hazard if it is used inappropriately. These differences make proper handling and control measures very important.

---

**What hazard classes use this pictogram?**

The only class that uses this pictogram is acute toxicity.

There are many categories within the acute toxicity class. There are categories used to describe the different ways the product can enter the body (e.g., oral (ingested/eaten), dermal (skin), or inhalation (breathed in)).

**Are there other hazards associated with acute toxicity?**

- Other health hazards - It is not uncommon for toxic products to have other health hazards associated with it besides acute toxicity.

- A toxic product may also have other properties such as being corrosive, flammable or reactive. **Always** read the label and the SDS to be sure you understand what is in the product and how to work with it safely.
Key Handling Information for Acute Toxicity Hazards

- Consult the label and SDS for information about ALL of the hazards and potential routes of exposure and be aware of the necessary precautions for the product you are using.

- If it is not possible to eliminate the toxic product, evaluate whether it is feasible to substitute a less hazardous product (e.g., products that are acute toxicity category 3 or 4 are less toxic than acute toxicity category 1 or 2).

- Avoid generating or releasing toxic product into the air (e.g., as vapours/mists/aerosols/dusts). Keep containers tightly closed when not in use.

- Reduce the amount that is used – do not stockpile.

- Work with the smallest amount possible.

- Use only in well-ventilated areas.

- Maintain good housekeeping (e.g., clean surfaces, no accumulation of dust).

- Avoid dry sweeping of solid product. Use a pre-wetting technique or vacuum equipped with high efficiency filter(s) instead.

- Inspect containers of toxic product for damage or leaks before handling. Open containers slowly and carefully to prevent spillage and dispersal into the air.

- Never eat, drink, smoke or chew gum in work areas where toxic products are used.

- Wash hands regularly throughout the day, including before washroom breaks, before lunch or coffee breaks or any other instances where an employee leaves the area.

- Report spills, leaks or problems with control measures immediately.

- Maintenance personnel need to know about the possible hazards of the products they might be exposed to.

- Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  - Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  - Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE etc.).
  - Be aware of the typical symptoms of an overexposure and appropriate first aid procedures. Any signs of illness should be reported immediately to the supervisor.
  - Ensure that appropriate medical response is available (e.g., antidotes, copy of SDS for emergency physician, firefighter, etc)

- If personal protective equipment (PPE) is required, the employer must ensure that workers are thoroughly trained in its selection, fit, use and maintenance. Refer to the SDS for guidance on selection. Emergency respiratory protection may be required in some situations.
Key Storage Information for Acute Toxicity Hazards

- Store in a cool, dry, well-ventilated area, away from direct sunlight and exit paths. Post warning signs. Be aware of any other special storage conditions.
- Avoid storing large quantities if possible.
- Inspect containers and storage area regularly for signs of leakage or damage. Contain spills or leaks by storing in trays made from compatible materials.
- Keep containers closed and sealed with tight-fitting lids.
- Empty containers may contain hazardous residue. Store separately. Keep closed.
- Store containers at a convenient height for handling, below eye level if possible. High shelving increases the risk of dropping containers and the severity of damage, injury and/or exposure if a fall occurs.
- Ensure that appropriate firefighting and spill cleanup equipment is readily available.
- Follow by-laws and regulations such as Fire Codes and health and safety regulations that apply to the workplace in your jurisdiction.
Health Hazard Pictogram

What types of health hazards are covered by this pictogram?

This pictogram is used for products that cause chronic health effects and those products with targeted health effects.

Chronic health effects occur from exposure to a product over a period of time, often measured in days, months or years. Long-term health effects such as carcinogenicity (cancer-causing) or respiratory sensitization are included under this pictogram. In addition, this pictogram is used for products which can cause targeted health impacts on a specific organ system (such as the kidneys, nerves or liver) that develop after a single exposure or after repeated exposure.

Chronic toxicity is different than acute toxicity. Acute toxicity refers to immediate health effects as a result of exposure to a toxic product. Chronic toxic effects tend to develop over time, often as a result of long-term exposure to a particular product. As an example, smoking a single cigarette is unlikely to cause a lasting toxic effect but smoking many cigarettes over time is linked with numerous adverse health effects. Chronic toxicity can also refer to a persistent adverse health effect that occurred as a result of a short-term exposure to a toxic product. For some chronic toxicity hazards, there is no known safe amount to which a person can be exposed.

What hazard classes use this pictogram?

This pictogram is used by a number of hazard classes in the health hazard group. If you see this pictogram on a product, it indicates that regular exposure could result in serious health issues. The health impacts will not be obvious right away. Always read the SDS and compare it with the label for the product. Understand how to use the product safely. Ask questions if you are not sure.

The hazard classes that use this hazard pictogram are:

- **Respiratory or skin sensitization - Respiratory sensitizer (Category 1, 1A and 1B)** - A respiratory sensitizer is a product that may at first cause a person to experience symptoms similar to a cold or allergies such as hay fever. With continued exposure, the symptoms progress and can resemble asthma with symptoms such as chest tightness, shortness of breath, difficulty breathing and/or coughing. A severe attack could result in death without proper medical attention.

- **Germ cell mutagenicity** - This hazard class includes products that can cause permanent changes (mutations) to the cells that can be passed on to future generations.

- **Carcinogenicity** - This hazard class includes product that can cause cancer.

- **Reproductive toxicity** - This hazard class addresses products that have a negative impact on sexual function and fertility in adult males and females. It also addresses developmental toxicity in the developing fetus. There is an additional category which includes products that may impact children who are breastfeeding but the health hazard pictogram is NOT used for this category.
- **Specific Target Organ Toxicity - Single exposure (STOT – single) (Cat. 1 and 2)** - This hazard class covers products that can have an impact on specific organs or systems in the body (e.g., liver, kidneys, blood) following a single exposure. Category 3 under STOT – single does not use the health hazard pictogram; instead it uses the exclamation mark. This category is for products that cause respiratory tract irritation or narcotic effects (such as drowsiness or dizziness).

- **Specific Target Organ Toxicity - Repeated exposure (STOT – repeated)** - This hazard class covers products that can have an impact on specific organs or systems in the body (e.g., liver, kidneys, blood) following prolonged or repeated exposures.

- **Aspiration hazard** - This hazard class is for liquids or solids that can enter the lungs, either through swallowing or from vomiting. Once the products enters the lungs, it can cause serious injury such as chemical pneumonia (which can also be fatal). The primary factor that determines the risk of aspiration is viscosity or whether the liquid is “thin” (more like water) or “thick” (more like honey). Low viscosity hydrocarbons (e.g., “thin” like turpentine and gasoline) can enter the lungs easily.

**Are there other hazards associated with health hazards?**

In addition to chronic toxicity hazards, remember that a product may have additional hazardous properties such as being acutely toxic (e.g., can have immediate toxic effects) or it may have other hazardous properties such as being corrosive or flammable.

ALWAYS check the product’s SDS and label on the containers to ensure that you know what is being used and the full range of potential hazards associated with a product.

**Key Handling Information for Health Hazard Products**

- Check the SDS for information about the hazards and necessary precautions for the product being used.
- If it is not possible to eliminate the chronic toxicity hazard, evaluate whether it is possible to substitute with a less hazardous product.
- Prevent uncontrolled release of the chronic toxicity hazard (e.g., dust, mist, vapour) into the air.
- Use only in well-ventilated areas.
- Reduce the amount that is used – do not stockpile.
- Work with the smallest amount possible.
- Avoid repeated or long-term skin contact with product or with contaminated equipment or surfaces.
- Keep work surfaces clean. Wipe up spills. Prevent accumulation of dust or other forms of residue. Prevent contamination of surfaces that unprotected personnel may use.
- Inspect all containers for damage or leaks before handling. Keep containers tightly closed when not in use or empty.
- Do not reuse empty containers – hazardous residue could remain inside.
- Immediately report leaks, spills or failures of the safety equipment (e.g., ventilation system). In the event of a spill or leak, exit the area immediately.
• Never eat, drink, smoke or chew gum in work areas where chronic toxicity hazards are used.
• Maintenance personnel need to know the possible hazards of the products they might be exposed to.
• Wash hands regularly throughout the day, including before washroom breaks, before lunch or coffee breaks or any other instances where an employee leaves the area.
• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  – Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE etc.).
  – Be aware of the typical symptoms of an overexposure and appropriate first aid procedures. Any signs of illness should be reported immediately to the supervisor. In event of a possible exposure, get medical attention. Symptoms can be delayed.
• If personal protective equipment (PPE) is required, the employer must ensure that workers are thoroughly trained in its selection, fit, use and maintenance. Refer to the SDS for guidance on selection. Emergency respiratory protection may be required in some situations.

Key Storage Information for Health Hazard Products
• Inspect containers and storage area regularly for signs of leakage or damage. Store in the original, labelled, shipping container.
• Keep amount in storage to an absolute minimum.
• Keep products cool and dry, in a well-ventilated area and away from direct sunlight. Post warning signs. Restrict access to authorized personnel only.
• Keep products away from incompatible materials. Check the SDS for specific information.
• Store the product on shelves closest to floor level (avoid storage above eye level). Do not store on high cabinets or shelves.
• Keep containers closed. Keep in closed containers with tight-fitting lids.
• Empty containers may contain hazardous residue. Store separately. Keep closed.
• Ensure that appropriate firefighting and spill cleanup equipment is readily available.
• Follow by-laws and regulations such as Fire Codes and health and safety regulations that apply to the workplace in your jurisdiction.
Exclamation Mark Pictogram

What kind of health effects are covered by this pictogram?
This pictogram refers to health hazards such as skin irritation or sensitisation, and eye irritation.

What hazard classes use this pictogram?
The health impacts covered by this pictogram may not be obvious to the worker right away, but the effects are generally reversible and of relatively short duration with proper medical treatment (and when further exposure is prevented). Always read the SDS and compare it with the label for the product. Understand how to use the product safely. Ask questions if you are unsure.

The hazard classes that use this hazard pictogram are:

- **Respiratory or skin sensitization - Skin sensitizer (Category 1, 1A and 1B)** - Skin sensitization is an allergic-type skin response involving symptoms such as itching, swelling, blisters, redness. Often an individual does not show any symptoms after the first exposure but with subsequent exposures, the skin reacts. Products such as latex (e.g., in gloves) and nickel are common skin sensitizers.

- **Specific target organ toxicity - Single exposure (Category 3)** - This category includes products that can cause irritating effects on the respiratory tract (such as coughing, throat irritation).

- **Skin corrosion/irritation - Skin irritation (Category 2)** - This category includes products which can cause reversible damage such as redness or inflammation after exposure.

- **Serious eye damage/eye irritation - Eye irritation (Category 2 and 2A)** - This category includes irritant products causing reversible effects within 21 days of exposure, or products that are severe skin irritants.

- **Acute toxicity - Oral, Dermal, Inhalation (Category 4)** - A product in this category fits the defined LD_{50} or LC_{50} values, and is used for products that are known to be harmful if swallowed, if inhaled, or when they come in contact with the skin.

Note: The exclamation mark may also be used to indicate products that contribute to the depletion of the ozone layer. Recall that classification and labelling of the environmental hazard group is not mandatory in Canada. However, suppliers may indicate these hazards on labels and SDSs if they choose to.

Are there other hazards associated with products with this pictogram?
In addition to meeting the criteria for this hazard pictogram, remember that a product may have additional hazardous properties such as being acutely toxic (e.g., can have immediate toxic effects) or it may have other hazardous properties such as being corrosive or flammable.

ALWAYS check the product's SDS and the label on the containers to ensure that you know what is being used and the full range of potential hazards associated with a product.
Key Handling Information for Products using the Exclamation Mark Pictogram

- Check the SDS for information about the hazards and necessary precautions for the product you are using.
- If it is not possible to eliminate the product, evaluate whether it is possible to substitute with a less hazardous product.
- Prevent uncontrolled release (e.g., dust, mist, vapour) into the air or the environment.
- Use in well-ventilated areas.
- Prevent contamination of surfaces that unprotected personnel may use.
- Avoid repeated or prolonged skin contact with product or with contaminated equipment or surfaces.
- Keep work surfaces clean. Wipe up spills. Prevent accumulation of dust or other forms of residue.
- Inspect all containers for damage or leaks before handling.
- Never eat, drink, smoke or chew gum in work areas.
- Wash hands regularly throughout the day, including before washroom breaks, before lunch or coffee breaks or any other instances where an employee leaves the area.
- Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  - Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  - Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE etc.).
  - Be aware of the typical symptoms of an overexposure and appropriate first aid procedures. Any signs of illness should be reported immediately to the supervisor.
- If personal protective equipment (PPE) is required, the employer must ensure that workers are thoroughly trained in its selection, fit, use and maintenance. Refer to the SDS for guidance on selection. Emergency respiratory protection may be required in some situations.

Key Storage Information for Products using the Exclamation Mark Pictogram

- Inspect containers and storage area regularly for signs of leakage or damage. Store in the original, labelled, shipping container.
- Keep cool and dry, in a well-ventilated area and away from direct sunlight. Keep containers closed.
- In general, store away from process and production areas and away from incompatible materials. Check the SDS for specific information pertaining to incompatible materials and conditions to avoid.
Environment Pictogram

What are hazards to the environment?
This hazard pictogram is used for products that can have a negative effect on the aquatic environment.

Recall that classification and labelling of this hazard group is not mandatory in Canada. However, suppliers may indicate these hazards on labels and SDSs if they choose to.

If the product only has this pictogram, the main concern is its toxicity for aquatic life. If the material has other pictograms, it is also hazardous to humans in the workplace (e.g., physical or health hazards).

Aquatic hazards may include “acute hazards to the aquatic environment” which evaluates short-term toxic impacts on various aquatic life forms (such as fish, crustaceans, algae and aquatic plants). It also includes “long-term hazards to the aquatic environment” which evaluates long-term (chronic) negative impacts on aquatic life forms such as bioaccumulation (buildup of material in organism) and degradation (persistence, or how long it will remain in the environment). Examples of long-term impacts for the aquatic environment could include reduced spawning, genetic problems in offspring and behavioural changes.

What hazard classes use this pictogram?
This pictogram covers acute (short-term) effects and chronic (long-term) effects on aquatic life.

Key Handling and Storage for Environmental Hazards

- Check the SDS for information about the hazards and precautions.
- Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, etc.). Contain spill quickly by diking with spill socks or suitable absorbent material (kitty litter, vermiculite, etc.). Do not leave spill site unattended.
- Dispose of product as hazardous waste properly – not by flushing down the drain.
- Prevent product from contaminating ground water, surface waters and sewer system. Protect floor drains, and cover the opening to sewer if able to do so and appropriate.
- Store the product in a secure, dry, well-ventilated location. Storage area should have sills and prevent leaks from escaping into sewers.
- Regularly inspect and maintain the equipment used for handling the substance.
- Use secondary containment for containers such as drip trays to contain leaks or spills. Empty trays regularly to avoid overflow. Monitor use of product. Unexpected increased use may indicate leakage.
- Isolate loading and unloading areas from surface water drainage systems. If not possible, protect drains using covers, sandbags, etc.
- Be aware of applicable legislation in your jurisdiction concerning materials that are hazardous to the environment (e.g., permits). Report leaks, spills to the people responsible for handling emergencies where you work.
Biohazardous Infectious Materials Pictogram

What are biohazardous infectious materials?
These materials are organisms or the toxins they produce that can cause diseases in people or animals. Included in this class are bacteria, viruses, fungi and parasites. As these organisms can live in body tissues and fluids, they should be treated as toxic. Urine and feces should be treated as toxic only if they are visibly contaminated with blood.

What hazard classes use this pictogram?
Only biohazardous infectious materials use this pictogram.

Where are biohazardous infectious materials found?
Biohazardous infectious materials are usually found in a hospital, health care facility, laboratories, veterinary practices and research facilities. Workers in these places do not usually know which tissues or fluids contain dangerous organisms. For this reason, the workers assume that every sample is hazardous and proper protection is used all the time. Examples of biohazardous infectious materials include the AIDS/HIV virus, Hepatitis B and salmonella.

Materials in this class should only be used or handled by individuals who are thoroughly trained and aware of the hazards and how to control them. This level of training is beyond the scope of this course.
Hazard Class Summary

There are 25 hazard classes used by GHS and 6 additional classes specific to WHMIS. There are too many to go through individually for a course like this and, in reality, very few people would work with all of them.

Instead, the instructor should consider presenting a more detailed look at the hazard classes that are actually used in the workplace. For each hazard class that the participants use, the instructor should outline the classes and/or categories, pictogram(s), signal words, hazard statements and key precautions. Common hazard classes such as flammable liquids, corrosive materials and skin or eye irritants are included in the participant workbook.

ALL of the hazard classes are included in the instructor manual. The hazard classes that are included in the participant workbook are highlighted below. If you find that different classes are required for your particular training course or workplace, make copies of those hazard classes from the Kit for the participants.

On their own, or with instructor guidance, have participants circle or underline the hazard classes below that are regularly used in the workplace:

*The Explosive class and Environmental hazard classes have not been adopted by WHMIS.
Physical Hazards - Explosives

Recall that classification and labelling of this hazard group is not mandatory in Canada. However, suppliers may indicate these hazards on labels and SDSs if they choose to.

Explosive products are considered to be a solid or liquid (or mixture) which is capable of producing gas at a temperature and pressure and speed which can cause significant damage to the surroundings.

Explosive products require very specific handling and storage precautions and are beyond the scope of this course. Using these products requires extensive training and controls.

Physical Hazards - Flammable gases

This class includes any gas which has a flammable range in air at 20°C and standard pressure. These gases readily form flammable mixtures with air and can easily catch fire and continue to burn. Some common flammable gases and their flammable ranges are: hydrogen (4%-75%); acetylene (2.5%- 81%); and propane (2.2%- 9.5%).

Key Precautions

- Understand ALL of the hazards associated with the product and how to use it safely. Read the label and the SDS thoroughly.
- Minimize the release into the workplace air. Be aware of dangers such as flash-back.
- Use only the smallest amount necessary for the job. Use only in well-ventilated areas.
- Remove all ignition sources and flammable/combustible materials in the area. No smoking. Practice good housekeeping and keep the area clear of materials that burn.
- Use non-sparking ventilation systems and equipment.
- Ground and bond cylinders, containers or equipment during transfer operations to prevent buildup of static charge.
- Understand and practice emergency procedures so that you know what to do if it becomes necessary.
- Have appropriate fire extinguisher available.
- If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
Physical Hazards - Flammable aerosols

A flammable aerosol is considered to be a product that contains one or more flammable components in an aerosol dispenser and that, when dispensed, is liable to ignite. Examples include spray paint, deodorants or adhesives. Often the propellant is a flammable product (such as propane, butane, isobutane). Sometimes the product suspended in the propellant is flammable as well (e.g., an adhesive).

Key Precautions

- Understand ALL of the hazards associated with the product and how to use it safely. Read the label and the SDS thoroughly.
- Store in a cool, dry area but protect from freezing. Keep out of direct sunlight. Do not store in areas with high temperatures, open flames or other ignition sources. Avoid basement storage or spaces which also have a heat source such as gas heaters, fireplaces, or boilers. Store large quantities of flammable aerosols in a flammable storage cabinet and separate from other flammable or incompatible materials.
- Minimize the release of flammable aerosol into the workplace air.
- Keep away from heat sources or open flame. Remove combustible materials in the area. No smoking. Be aware of dangers such as flash-back (flammable aerosol flashing back into the container and resulting in an explosion).
- Protect aerosol cans from damage such as drops or punctures.
- Inspect the container before each use for signs of damage or corrosion. Do not use if damaged. Use open cans and older cans first.
- Use only in well-ventilated areas. Use only the smallest amount necessary for the job. Non-sparking ventilation systems and equipment may be required.
- Understand and practice emergency procedures so that you know what to do if it becomes necessary.
- If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
Physical Hazards - Oxidizing gases

Oxidizing gases are a significant fire hazard. An oxidizing gas is any gas which can provide oxygen or contribute to the combustion of other material more than air does. Examples of oxidizing gases include any gases containing oxygen at higher than atmospheric concentrations (above 23 to 25 percent), nitrogen oxides, and halogen gases such as chlorine and fluorine.

Oxygen is a necessary component for a fire to burn. Oxidizers do not usually burn by themselves but they present a significant hazard because they will:

- Increase the intensity and speed of a fire by providing more oxygen.
- Cause materials that normally do not burn to suddenly catch on fire, sometimes even without an ignition source (e.g., spontaneous combustion).

Fires fuelled by oxidizing product are tough to extinguish and can spread quickly.

Table 9: Oxidizing gases

Key Precautions

- Understand ALL of the hazards associated with the product and how to use it safely. Read the label and the SDS thoroughly.
- Minimize release into the workplace air. Use only in well-ventilated areas. Use only the smallest amount necessary for the job.
- Keep cool and dry and away from direct sunlight. Store in conditions according to the supplier recommendations.
- Remove all ignition sources and combustible materials in the area. Keep away from clothing or other combustible materials. No smoking.
- Non-sparking ventilation systems and equipment may be necessary.
- Keep valves and fittings free from oil and grease.
- Understand and practice emergency procedures so that you know what to do if it becomes necessary.
- If the oxidizing gas is also a gas under pressure, follow the additional safety steps required. The label and SDS will provide guidance.
- If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
Physical Hazards – Gases under pressure

This class covers different types of gases which are stored under pressure in a container: the gas may be compressed, liquefied, chilled or dissolved in a carrier material.

Table 10: Gases under pressure

</table>
Key Precautions for Gases under pressure:

- Understand all of the hazards associated with the product, and how to use it safely. Check the SDS for information about the hazards and necessary precautions for the type of pressurized gas being used.
- Prevent the release of gas into the workplace. Use only in well-ventilated areas and avoid confined spaces. An oxygen-deficient atmosphere can occur very quickly. Oxygen-monitoring systems may be necessary.
- Use the smallest possible quantity for the job.
- Avoid direct skin contact with extremely cold liquids or compressed gases escaping from the cylinder. Wear cold insulating gloves and either a face shield or eye protection, if recommended.
- Carefully check all connections before use and periodically during use, to be sure they are tight, clean, in good condition and not leaking.
- Understand and practice emergency procedures so that you know what to do if it becomes necessary. If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance.

Cylinders

- Store compressed gas cylinders in cool, dry, well-ventilated areas, away from incompatible materials and ignition sources. Make sure that the storage temperature does not exceed 52°C (125°F).
- Do not allow flames to contact cylinders. No smoking.
- Secure cylinders to a wall or rack in an upright position. Leave the cylinder cap in place until the cylinder is secured and ready for use.
- Use the appropriate regulator. Ensure that equipment is compatible with cylinder pressure and contents. Do not use homemade adaptors or force connections. Never tamper with safety devices in cylinders, valves or equipment.
- Inspect cylinders for damage and proper labels. Never open a damaged valve. Ensure cylinders are not giving off odours or hissing sounds.
- Do not apply any lubricant, jointing compound or tape to cylinder valves, fittings or regulator threads. Keep dirt, rust, oil or grease away from all cylinders or fittings.
- Do not drop or bang cylinders against each other. Move cylinders using a hand truck or cart designed for the purpose.
- Report leaks immediately and evacuate if appropriate.
- Properly and promptly dispose of “empty” or unlabelled cylinders.
- Do not keep cylinders longer than the supplier recommends.

Cryogens

- Prevent frostbite by never allowing cryogenic liquids to touch your skin. Never wear watches, rings or bracelets because they can freeze to exposed skin if splashed by an ultracold gas.
- Always wear loose fitting thermally insulated gloves when handling anything that may have been in contact with a cryogen.
- Wear eye protection and faceshield when working with a cryogen.
- Store cryogen containers in cool, dry, well-ventilated areas, away from incompatible materials and ignition sources.
- Ensure that pressure relief valves are working properly and are not frozen shut.
- Never tamper with safety devices on vessels, valves or equipment.
- Fill containers only with the liquids for which they were designed. Label each container. Fill vessels to the indicated level only. Do not overfill.
- Proceed slowly when filling a container or inserting objects into a cryogen to minimize boiling and splashing.
Physical Hazards - Flammable liquids

For a fire to occur, three elements must come together at the same time and in the right proportions: fuel, heat (e.g., an ignition source such as a spark) and air/oxygen. A key to fire prevention and working safely with flammable products is to make sure that the three elements are not present together in the right amounts at any given time. In workplace settings, controlling the fuel (e.g., flammable product), keeping quantities low, and eliminating sources of ignition are ways to handle flammable products safely.

Flammable liquids are very common in the workplace. There are 4 categories of flammable liquids. A category 1 (extremely flammable liquid and vapour) is more hazardous than a category 4 (combustible liquid).

Key Precautions

Handling Precautions

• Check the label and SDS for information about the hazards and necessary precautions for the flammable liquid being used.
• Use the smallest amount of flammable liquid necessary for the job.
• Use flammable liquids only in well-ventilated areas. Minimize the risk of fire/explosion by preventing the release of the products into the workplace air. Keep containers tightly closed.
• Eliminate ignition sources and combustible materials from area where flammable products are used (e.g., oily rags, cardboard boxes). Make sure that there is no smoking on the premises. Keep work areas clean and tidy.
• Keep flammable liquids out of direct sunlight and away from incompatible materials (e.g., strong oxidizers). Do not heat containers containing flammable products.
• In some cases, non-sparking ventilation systems and equipment (such as non-sparking tools) may be necessary.
• Ground and bond containers during transfer operations to prevent buildup of static charge.
• Dispose of dirty rags or other waste contaminated by flammable liquids in approved flammable waste cans (not regular garbage). Empty these containers on a regular basis.
• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – Ensure that appropriate fire extinguishers are available in the immediate work area (e.g., dry chemical or carbon dioxide). Flammable liquid fires require Class B type of extinguishers. NEVER use a solid stream of water to extinguish a flammable liquid fire because it can cause the fuel to scatter, spreading the flames.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  – Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, non-sparking tools, etc.). Avoid using combustible materials (such as paper towels or sawdust) to clean up or absorb spills.
• If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance.

Storage Precautions

• Use equipment designed for flammable liquid storage – e.g., flammable storage fridge, flammable storage cabinets or flammable safety cans. Make sure these devices are labelled and sealed or vented appropriately.
• Do not store with other types of product. Check SDS for incompatibles (such as oxidizing products).
• In general, avoid storing flammable liquids in basements. Ground floor storage is usually preferred as it provides easier access for emergency situations.
• Make sure that storage rooms have properly designed ventilation systems that are regularly maintained.
• Keep away from potential ignition sources such as heat, sparks or open flames. No smoking in area. Post warning signs. Never store beside exits or in a way that blocks access.
• Inspect storage areas regularly for any deficiencies such as damaged or leaking containers. Provide drip trays and empty them often wherever recurring leakages occur.
• The local Fire Code will specify the quantity of flammable liquids that may be stored at the workplace in your jurisdiction.
Physical Hazards - Flammable solids

A flammable solid is a solid which is readily combustible, or may cause or contribute to fire through friction. Often the product is in a form such as powder, granules or paste. These forms make it easier to ignite these products, and also allow the fire to spread very quickly.

Some examples of flammable solids include gunpowder, alkali metals, magnesium metal, metallic hydrides, some organometallic compounds and sulfur. Many flammable solids react with water and cannot be extinguished with conventional dry chemical or carbon dioxide extinguishers.

Key Precautions

- Check the label and SDS for information about the hazards and necessary precautions for the product you are using.
- Many of the same principles for handling and storage of flammable liquids apply to flammable solids.
- Use the smallest amount necessary for the job.
- Minimize the risk of fire/explosion by preventing the dispersal or spread of the solid product into the workplace air. Use only in well-ventilated areas. In some cases, non-sparking ventilation systems and equipment (such as non-sparking tools) may be necessary.
- Always keep flammable solids stored away from oxidizers, and away from heat or ignition sources such as open flames, sparks, radiators, electric power panels. Keep combustible materials away from area where a flammable solid is used (e.g., oily rags, cardboard boxes). Make sure that there is no smoking on the premises.
- Keep the workplace clean and tidy. Promptly and properly clean up spilled product.
- Keep away from incompatible materials such as oxidizers. Check the SDS for specific information and recommendations.
• Do not smoke, eat or drink in work areas. Wash hands thoroughly after handling.
• Make sure that storage rooms have properly designed ventilation systems that are regularly maintained. Post warning signs. Do not store near exits or in a way that blocks access.
• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – Ensure that appropriate fire extinguishers are available. Be aware of at least two different exit paths in the event of fire.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  – Have spill control procedures and equipment ready (PPE, non-sparking tools, etc.). Avoid using combustible materials (such as paper towels) to wipe or clean up spills.
• If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
**Physical Hazards - Self-reactive substances and mixtures**

This hazard class covers liquid or solids products that are sensitive (unstable) with temperature changes and which are able to have a strongly exothermic decomposition (e.g., the reaction is fast and gives off a lot of energy – it is potentially explosive) even without the presence of air.

This class does not include products already classified as explosive, organic peroxides or as oxidizing.

Key Precautions

- Consult the label and SDS for information about the hazards and necessary precautions for the product being used.
- Use only in well-ventilated areas. Use the smallest amount necessary for the job.
- Minimize the risk of fire/explosion by preventing release into the air. Keep containers closed when not in use.
- Keep in a cool and dry, in a well-ventilated area and away from direct sunlight and according to any other conditions that may be required. These products are sensitive to temperature changes. Maintain appropriate temperature in work and storage area according to the supplier’s recommendations. Storage areas may need alarms that warn when temperatures are higher or lower than required.
- Keep away from heat and eliminate ignition sources such as sparks or open flames. Keep combustible materials away from area where the product is used (e.g., oily rags, cardboard boxes). No smoking.
- Keep work surfaces clean. Prevent accumulation of dust or other residues. Promptly and properly clean up spilled product.
- Inspect containers and storage area regularly for signs of leakage or damage. Protect containers from impact, vibration, or shock. Keep the amount of these materials in storage as small as possible.
- Store these products in containers that the chemical supplier recommends. Normally these are the same containers in which the product was shipped.
- Keep away from incompatible materials. Check the SDS for specific information and recommendations.
- Do not smoke, eat or drink in work areas. Wash hands thoroughly after handling.
- Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  - Do not return unused products to the original container.
  - Ensure that appropriate fire extinguishers are available.
  - Be aware of at least two different exit paths in the event of fire.
  - Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  - Have spill control procedures and equipment ready. Avoid using combustible materials (such as paper towels) to wipe or clean up spills.
- If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
Physical Hazards - Oxidizing liquids

Oxidizing liquids are a significant fire hazard. An oxidizing liquid is any liquid which can provide oxygen or contribute to the combustion of other material more than air does. Common oxidizing liquids include nitric acid, perchloric acid and hypochlorites.

Oxygen is a necessary component for a fire to burn. Oxidizers do not usually burn by themselves but they present a significant hazard because they will:

- Increase the intensity and speed of a fire by providing more oxygen.
- Cause materials that normally do not burn to suddenly catch on fire, sometimes even without an ignition source (e.g., spontaneous combustion).

Fires fuelled by oxidizing products are hard to extinguish and can spread quickly.

Key Precautions

- Check the label and Safety Data Sheet (SDS) for information about the hazards and necessary precautions for the products being used.
- Use only in well-ventilated areas. Use the smallest amount necessary for the job. Keep the amount of these products in storage as small as possible.
- Minimize the risk of fire/explosion by preventing release into the workplace air. Keep containers closed when not in use.
- Keep away from incompatible materials. Check the SDS for specific information and recommendations.
- Keep away from heat and eliminate ignition sources such as sparks or open flames. Keep combustible materials away from area where the material is used (e.g., oily rags, cardboard boxes). No smoking.
- Keep work surfaces clean. Promptly and properly clean up spilled products using non-combustible materials. Avoid spilling products and contaminating the skin or clothing.
- Inspect containers and storage area regularly for signs of leakage or damage. Contain spills or leaks by storing in trays made from compatible materials.
- Be very cautious about mixing oxidizers with water. Follow the chemical supplier’s directions. Some oxidizers will generate large amounts of heat when they are mixed with water.
- Never return unused products to the original container.
- Do not reuse empty containers – hazardous residue could remain inside.
- Keep in a cool and dry, in a well-ventilated area and away from direct sunlight and according to any other conditions that may be required.
- Do not use wooden pallets or other combustible pallets for storing containers of oxidizing products.
- Walls, floors, shelving, and fittings in storage areas should be constructed of non-combustible materials.
- Do not smoke, eat or drink in work areas. Wash hands thoroughly after handling.
- Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  - Ensure that appropriate fire extinguishers are available.
  - Be aware of at least two different exit paths in the event of fire.
  - Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  - Have spill control procedures and equipment ready. Avoid using combustible materials (such as paper towels) to wipe or clean up spills.
- If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance. Fire resistant or flame retardant clothing may be recommended.
Physical Hazards - Oxidizing solids

Oxidizing solids are a significant fire hazard. An oxidizing solid is any solid which can provide oxygen or contribute to the combustion of other material more than air does.

Oxygen is a necessary component for a fire to burn. Oxidizers do not usually burn by themselves but they present a significant hazard because they will:

- Increase the intensity and speed of a fire by providing more oxygen.
- Cause materials that normally do not burn to suddenly catch on fire, sometimes even without an ignition source (e.g., spontaneous combustion).

Fires fuelled by oxidizing products are tough to extinguish and can spread quickly.

  - Have spill control procedures and equipment ready. Avoid using combustible materials (such paper towels) to wipe or clean up spills.
- If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance. Fire resistant or flame retardant clothing may be recommended.
Physical Hazards - Pyrophoric liquids

Pyrophoric liquids will ignite spontaneously in air. This class has the ability for the liquid to ignite within 5 minutes of coming into contact with air.

These products require very careful handling and storage. Pyrophoric products are extremely reactive toward oxygen (air) and in most cases, water, and must therefore not be exposed to the atmosphere. Review the label and SDS to be sure.

Table 16: Pyrophoric liquids

<table>
<thead>

</tbody>
</table>

Key Precautions

- Check the label and SDS for information about the hazards and necessary precautions for the product being used.
- Purchase the minimum amount possible and use the smallest amount necessary for the job.
- Do not expose to air. Pyrophoric liquids can be handled safely in controlled inert atmospheres that exclude air (e.g., a gas such as argon or nitrogen used to blanket the material and keep out air).
- Make sure that all use and handling of pyrophoric liquids is performed in an appropriate glove box or in a chemical fume hood using techniques to ensure isolation from the air/moisture.
- Keep away from heat and eliminate ignition sources such as sparks or open flames. Keep combustible materials away from area where the material is used (e.g., oily rags, cardboard boxes). No smoking.
- Keep the workspace clear of non-essential materials. Keep work surfaces clean. Wipe up spills using non-combustible materials. Promptly and properly clean up spilled product.
- Keep a container of sodium carbonate (soda ash) or lime or dry sand within arm's reach when handling pyrophoric materials (to smother a reaction with air) or for spills.
- Avoid working alone with pyrophoric product. Follow your workplace's Working Alone procedure.
- Containers carrying pyrophoric products must be clearly labeled with the correct chemical name and hazard warning. Glass bottles of pyrophoric products should not be handled or stored unprotected. The metal can shipped with each bottle should be retained as a protective container for each bottle for transporting and storage.
- Regularly inspect containers of pyrophoric product. Make sure that the integrity of containers is maintained. Contain spills or leaks by storing in trays made from compatible products.
- Keep pyrophoric products separated from other materials.
• Never return unused product to the original container.
• Do not reuse empty containers – hazardous residue could remain inside.
• Do not smoke, eat or drink in work areas. Wash hands thoroughly after handling.
• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – Ensure that appropriate fire extinguishers are available. The recommended fire extinguisher for many pyrophoric products is a standard dry powder (ABC) type. Consult the SDS to confirm however.
  – Be aware of at least two different exit paths in the event of fire.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  – Consider purchasing a fire blanket and keeping it near the working area to quickly extinguish flames on a person.
  – Have spill control procedures and equipment ready. Do not use combustible materials (such paper towels) to wipe or clean up spills as they may increase the chance of igniting the material.
• If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
Physical Hazards - Pyrophoric solids

Pyrophoric solids will ignite spontaneously in air. These products have the ability to ignite within 5 minutes of coming into contact with air.

These materials require very careful handling and storage. Pyrophoric reagents are extremely reactive toward oxygen (air) and in most cases, water, and must therefore not be exposed to the atmosphere. Review the label and SDS to be sure.

• If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
Physical Hazards - Self-heating substances and mixtures

A self-heating substance is a solid or liquid which by reacting with air and without added energy, can self-heat and catch fire. A source of ignition is not required; the product is able to generate sufficient energy (self-heat) to the point where it can ignite. Examples include piled hay and peat.

Note that this hazard class differs from pyrophoric products in that it will generally only ignite when in large amounts (kilograms) and after extended periods of time (hours or days). Remember that pyrophoric products react in air within 5 minutes.

Table 18: Self-heating substances and mixtures

Key Precautions

- Check the label and SDS for information about the hazards and necessary precautions for the products being used.
- Purchase the minimum amount possible and use the smallest amount necessary for the job. Small quantities mean less likelihood of generating sufficient heat to ignite.
- Keep away from heat and eliminate ignition sources such as sparks or open flames. Keep combustible materials away from area where the material is used (e.g., oily rags, cardboard boxes). No smoking.
- Keep the workspace clear of non-compatible and non essential materials.
- Keep work surfaces clean. Wipe up spills using noncombustible materials. Promptly and properly clean up spilled products.
- Ensure that containers are clearly labeled and not damaged.
- Do not return unused products to the original container.
- Do not reuse empty containers – hazardous residue could remain inside.
• Contain spills or leaks by storing in trays made from compatible materials.
• Do not smoke, eat or drink in work areas. Wash hands thoroughly after handling.
• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – Ensure that appropriate fire extinguishers are available.
  – Be aware of at least two different exit paths in the event of fire.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
• If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
Physical Hazards - Substances and mixtures which, in contact with water, emit flammable gases

This hazard class covers products which react with water and release flammable gas. These products are very serious fire hazards.

Table 19: Substances and mixtures, which in contact with water, emit flammable gases

</table>

Key Precautions

- Check the label and SDS for information about the hazards and necessary precautions for the product being used.
- Purchase the minimum amount possible and use the smallest amount necessary for the job.
- Keep away from heat and eliminate ignition sources such as sparks or open flames. Keep combustible materials away from area where the product is used (e.g., oily rags, cardboard boxes). No smoking.
- Keep work surfaces clean. Wipe up spills using non-combustible materials. Promptly and properly clean up spilled material. Contain spills or leaks by storing in trays made from compatible materials.
• Do not return unused product to the original container.
• Ensure that containers are clearly labeled and not damaged. Label containers with date opened and disposal date.
• Keep containers away from heat and out of direct sunlight. Avoid sudden temperature changes.
• Keep away from all incompatible materials. Consult the SDS for specific details.
• Do not reuse empty containers – hazardous residue could remain inside.
• Do not smoke, eat or drink in work areas. Wash hands thoroughly after handling.
• Avoid having water (e.g., extinguishers and sprinklers) in areas where water sensitive chemicals are stored.
• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – Ensure that appropriate fire extinguishers are available.
  – Be aware of at least two different exit paths in the event of fire.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  – Have spill control procedures and equipment ready. Avoid using combustible materials (such paper towels) to wipe or clean up spills as they may increase the chance of igniting the material.
• If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
Physical Hazards - Organic peroxides

Organic peroxides are highly reactive and hazardous products. Organic peroxides ignite easily and burn rapidly. Some can react explosively with heating. Organic peroxides are often very unstable and are generally sensitive to light and should be stored in darkness. Some are sensitive to temperature changes or friction (e.g., shaking or bumping a container that holds organic peroxide product). Organic peroxides may react explosively with metals. Organic material that is contaminated with organic peroxides has the same hazard.

Some materials may form organic peroxides spontaneously. Examples of “peroxide-forming materials” are diethyl ether, tetrahydrofuran, or ethylene glycol dimethyl ether. In some cases, stabilizer can be added to avoid or minimize the formation.

Very strict safety protocols are required when working with organic peroxides and users must be aware of the possibility of peroxide formation. The SDS will provide direction.

</table>
Key Precautions

- Check the label and SDS for information about the hazards and necessary precautions for the product being used. Do not use the product if physical characteristics and appearance do not match the SDS or if product is of unknown age.
- Use only in well-ventilated areas. Use the smallest amount necessary for the job.
- Minimize release into the workplace air. Keep containers closed when not in use.
- Handle containers safely to avoid damaging them. Some are sensitive to friction, shock (e.g., dropping or bumping container).
- Inspect containers and storage area regularly for signs of leakage or damage.
- Keep in a cool and dry, in a well-ventilated area and away from direct sunlight and according to any other conditions that may be required. These products can be sensitive to temperature changes and light. Maintain appropriate conditions in work and storage area according to the supplier’s recommendations.
  - Do not chip or grind lumps to break them up. If crystals have precipitated in containers, contact the chemical supplier or other qualified person about safe handling and disposal in this situation.
  - Generally keep containers tightly closed unless the supplier’s instructions state otherwise to avoid contamination of the product or evaporation of solvents.
- Keep the amount of these products in storage as small as possible. Use a “first in/first out” policy and to mark the date that the container was received and the date it was first opened. Peroxides may form in containers that have been opened and remain in storage. Check SDS for maximum storage times (e.g., 6 months) and dispose of expired products. Avoid long-term storage.
- Check stabilizer/inhibitor levels regularly and replenish as necessary or as specified by the manufacturer.
- Keep away from heat and eliminate ignition sources such as sparks or open flames. Keep combustible materials away from area where the product is used (e.g., oily rags, cardboard boxes). No smoking.
- Keep work surfaces clean. Promptly and properly clean up spilled product.
- Store these products in containers that the chemical supplier recommends. Normally these are the same containers in which the product was shipped.
- Do not smoke, eat or drink in work areas. Wash hands thoroughly after handling.
- Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  - Ensure that appropriate fire extinguishers are available.
  - Be aware of at least two different exit paths in the event of fire.
  - Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  - Have spill control procedures and equipment ready. Avoid using combustible materials (such as paper towels) to wipe or clean up spills.
- If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
Physical Hazards - Corrosive to metals

This class covers products that are corrosive to metals (e.g., can damage or destroy metals such as steel and aluminum). Common corrosive products are nitric acid, hydrochloric acid, and sodium hydroxide solutions. When a corrosive “eats” through a container, the content may leak or spill and cause damage, or may injure or expose workers in the area.

Table 21: Corrosive to metals

<table>
<thead>
<tr>

<td>Signal word</td>
</tr>
<tr>
<td></td>
<td>Warning</td>
</tr>
<tr>
<td></td>
<td>Hazard statement</td>
</tr>
<tr>
<td></td>
<td>May be corrosive to metals</td>
</tr>
</tbody>
</table>

Key Precautions

- Understand all of the hazards associated with the product and how to use it safely. Check the SDS for information about the hazards and necessary precautions for the corrosive product you are using.
- Keep in original packaging. Inspect containers of corrosive product for damage or leaks before handling.
- Do not add water to corrosive products because this can cause a violent reaction. If it is absolutely necessary to mix a corrosive with water, do so slowly adding the corrosive to cold water, in small amounts, and stir frequently.
- Prevent the release of corrosive product (dust, mist, gas or vapour) into the workplace.
- Use only in well-ventilated areas. Use the smallest amount necessary. Keep the amount of these products in storage as small as possible.
- Dispense corrosives carefully and keep containers closed when not in use. Use corrosion-resistant equipment such as pumps, scoops or shovels to handle corrosive products. Clean up any spills and buildups of corrosives promptly and safely.
- Use only the types of resistant containers recommended by the manufacturer or supplier.
- Do not touch drums that are swollen or damaged. Report the condition to your supervisor immediately. Drums may need to be vented periodically by trained personnel in order to release pressure buildup. The SDS will indicate if and how often this procedure is required.
- Avoid direct contact with corrosive products. Wear appropriate personal protective equipment (PPE) as specified by your employer for the job. This equipment may include respiratory protection, goggles, face shield and chemical protective clothing like an apron and gloves made from corrosion-resistant material.
- Wash hands before eating, drinking, smoking or going to the toilet. Avoid touching your skin with contaminated hands. Clean your skin thoroughly.
- Remove and clean contaminated clothing before wearing it again, or discard it.
- Do not reuse empty containers - a hazardous corrosive residue could remain inside.
- Maintenance personnel need to know the possible hazards of the products they might be exposed to.
- Store away from incompatible materials and in a cool, dry, well-ventilated area and out of direct sunlight.
- Use corrosive storage cabinets for large quantities of corrosive materials. These units have corrosion-resistant interiors and hardware (e.g., door hinges and shelf brackets). Flammable storage cabinets are NOT corrosion-resistant.
- If the corrosive product is not stored in specific acid or base cabinets, store the product on shelves closest to floor level (avoid storage above eye level). Do not store corrosive products on high cabinets or shelves.
- Store containers in trays. This system provides a secondary containment and is recommended as backup in case of container failure or breakage. Ensure containment device is compatible with the corrosive product and will contain the full volume of the containers it is holding.
- Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  - Ensure that appropriate fire extinguishers are available.
  - Be aware of at least two different exit paths in the event of fire.
  - Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  - Know where the closest eyewash station and safety shower are located and how to use them. Flush contaminated eyes or skin with water for the time as recommended on the SDS or as directed by a medical professional. Call immediately for emergency medical assistance.
  - Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, etc.).
- If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
Physical Hazards - Combustible dusts

This class is specific to WHMIS. Combustible dusts are defined as “a mixture or substance that is in the form of finely divided solid particles that, upon ignition, is liable to catch fire or explode when dispersed in air”. Essentially, a combustible dust is any fine material that has the ability to catch fire and explode when mixed with air. Combustible dusts can be from:

- most solid organic materials (such as sugar, flour, grain, wood, etc.)
- many metals, and
- some nonmetallic inorganic materials.

Table 22: Combustible dusts

<table>
<thead>

</tr>
<tr>
<td></td>
<td>May form combustible dust concentrations in air.</td>
</tr>
</tbody>
</table>

Key Precautions

- Understand ALL of the hazard associated with the product and how to use it safely. Read the label and SDS thoroughly.
- Where possible, avoid horizontal surfaces (such as window ledges, beams, light fittings, etc.) where dust can accumulate. Eliminate “hidden” areas where dust can accumulate unnoticed.
- Do not use brooms or compressed air hoses to clean surfaces. Only use vacuums approved for dust collection.
- Do not use fans to remove dust. Fans only stir the dust, adding dust particles into the air.
- Use an appropriate dust extraction and collection system with the inlet located as close to the dust producing process as possible. Follow required standards and codes when installing these systems. Locate dust collectors outdoors, where possible.
- Remove open flames, sparks, friction, heat sources, and other sources of ignition, including static electricity.
- Select and use intrinsically safe tools or machinery.
- Inspect for dust at regular intervals.
- Establish a housekeeping program that will remove dust regularly.
- Use proper equipment and techniques when cleaning dust. Care must be taken to minimize dust clouds, and only use vacuums approved for dust collection.
- Regularly inspect machines, ducts, and ventilation systems for dust. Repair or clean promptly.
- If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
Physical Hazards - Simple asphyxiants

This class is specific to WHMIS. Simple asphyxiants are defined as “any gas that is liable to cause asphyxiation by the displacement of air”. When the oxygen in air is displaced (taken over by), less oxygen is available to breathe. Symptoms such as rapid breathing, rapid heart rate, clumsiness, emotional upsets and fatigue can result. As less oxygen becomes available, nausea and vomiting, collapse, convulsions, coma and death can occur. Symptoms occur more quickly with physical effort.

Table 23: Simple asphyxiants

</tr>
<tr>
<td></td>
<td>May displace oxygen and cause rapid suffocation.</td>
</tr>
</tbody>
</table>

Key Precautions

- Understand ALL of the hazard associated with the product and how to use it safely. Read the label and SDS thoroughly.
- Make sure that other controls such as ventilation are in place and functioning properly to prevent the build up of this gas.
- Use appropriate personal protective equipment (PPE), where necessary. If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
- In case of oxygen deficiency: take precautions to ensure your own safety before attempting to rescue another person (e.g., wear appropriate protective equipment).
Physical Hazards – Pyrophoric gases

This class is specific to WHMIS. Pyrophoric gases will ignite spontaneously in air at temperatures at or below 54 °C.

These gases require very careful handling and storage. Pyrophoric products are extremely reactive. Review the label and SDS.

Table 24: Pyrophoric gases

<table>
<thead>

</tbody>
</table>

Key Precautions

- Understand ALL of the hazard associated with the product and how to use it safely. Read the label and SDS thoroughly.
- Purchase the minimum amount possible and use the smallest amount necessary for the job.
- Keep away from heat and eliminate ignition sources such as sparks or open flames. Make sure there is no smoking.
- Avoid working alone with pyrophoric product.
- Regularly inspect containers of pyrophoric product. Ensure that the integrity of the containers is maintained.
- Keep pyrophoric products separated from other materials.
- Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  - Ensure that appropriate fire extinguishers are available.
  - Be aware of at least two different exit paths in the event of fire.
  - Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  - Consider purchasing a fire blanket and keeping it near the working area to quickly extinguish flames on a person.
  - Have spill control procedures and equipment ready. Do not use combustible materials (such as paper towels) to wipe or clean up spills as they may increase the chance of igniting the material.
- If personal protective equipment (PPE) is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
Physical Hazards – Physical Hazards Not Otherwise Classified (PHNOC)

This class is specific to WHMIS. This class is used for physical hazards not otherwise covered by WHMIS where a chemical reaction with this product can cause serious injury or death at the time of the reaction. Pictograms, signal words, hazard statements other precautionary statements will depend on the exact nature of the hazard.

Table 25: Physical Hazards Not Otherwise Classified (PHNOC)

<table>

<td></td>
<td>Signal word</td>
</tr>
<tr>
<td></td>
<td>Hazard statement</td>
</tr>
</tbody>
</table>

Key Precautions

- Understand ALL of the hazards associated with the product and how to use it safely. Read the label and SDS thoroughly.
**Health Hazards - Acute toxicity**

The acute toxicity class uses the skull and crossbones or the exclamation mark pictogram to indicate chemicals that can cause adverse health effects. These products are fatal, toxic or harmful if inhaled, following skin contact, or if swallowed. Acute toxicity refers to effects occurring following skin contact or ingestion exposure to a single dose, or multiple doses given within 24 hours, or an inhalation exposure of 4 hours. Acute toxicity could result from exposure to the product itself, or to a product that, upon contact with water, releases a gaseous substance that is able to cause acute toxicity. The SDS and label will indicate if one or more routes of exposure is a concern. For some products, the primary concern may be inhalation. For others, skin contact and absorption may be more of an issue. For many products, there are multiple routes of exposure that are a concern. Read the SDS and label carefully to fully understand the true nature of the hazard.

**Table 26: Acute toxicity**

</tbody>
</table>
**Key Precautions**

- Check the label and SDS for information about the hazards and potential routes of exposure and necessary precautions for the product you are using.
- Try to eliminate use of the product or substitute with a less hazardous one.
- Avoid generating or releasing product into the air (e.g., as vapours/mists/aerosols/dusts). Keep containers tightly closed when not in use.
- Use only in well-ventilated areas.
- Reduce the amount that is used and keep working quantities to a minimum – do not stockpile.
- Use the appropriate personal protective equipment (PPE), where necessary. If PPE is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
- Maintain good housekeeping (e.g., clean surfaces, no accumulation of dust). Avoid dry sweeping of solid materials. Use a pre-wetting technique or vacuum equipped with high efficiency filter(s) instead.
- Store in the original, labelled, shipping container. Inspect containers of toxic product for damage or leaks before handling. Inspect containers and storage area regularly for signs of leakage or damage. Secondary containment of toxic containers is recommended as backup in case of container failure or breakage.
- Store containers of toxic products in a secure location, away from process and production areas and away from incompatible materials.
- Empty containers may contain hazardous residue. Store separately. Keep closed.
- Store containers at a convenient height for handling, below eye level if possible.
- Open containers slowly and carefully to prevent spillage and dispersal into the air.
- Never eat, drink, smoke or chew gum in work areas where toxic products are used.
- Maintenance personnel need to know the possible hazards of the products they might be exposed to.
- Wash hands before eating, drinking, smoking or going to the toilet. Avoid touching your skin or eyes with contaminated hands. Clean thoroughly at the end of the workday. Remove and clean contaminated clothing before wearing it again, or discard it.
- Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  - Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  - Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE etc.).
  - Be aware of the typical symptoms of an overexposure and appropriate first aid procedures. Any signs of illness should be reported immediately to the supervisor.
  - Ensure that appropriate medical response is available (e.g., antidotes, copy of SDS for emergency physician, firefighter, etc.)
Health Hazards - Skin corrosion/irritation

Products that can cause irreversible (permanent) damage to exposed skin are considered to be a Category 1 (1A, 1B, or 1C) Skin corrosion. Examples are strong acids and bases (e.g., pH less than 2) and pH greater than 11.5 (very strong alkali or basic). Category 2 products are classed as skin irritation. Category 2 products can cause reversible skin damage.

Table 27: Skin corrosion/irritation

<tr>
<td></td>
<td>Hazard statement: Causes skin irritation</td>
</tr>
</tbody>
</table>

Key Precautions

- Understand all of the hazards associated with the product and how to use it safely. Check the label and SDS for information about the hazards and necessary precautions.
- Prevent uncontrolled release (e.g., liquid, dust, mist, vapour) into the workplace air.
- Use only in well-ventilated areas. Use the smallest amount necessary.
- Avoid direct contact, particularly with corrosive products.
- Wear appropriate personal protective equipment (PPE). This equipment may include respiratory protection, goggles, face shield and gloves. If PPE is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
- Avoid repeated or long-term skin contact with product, or with contaminated equipment or surfaces.
- Inspect containers for damage or leaks before handling.
- Open containers slowly and carefully. Dispense carefully and keep containers closed when not in use. Clean up any spills or dust buildup promptly and safely.
- Wash hands before eating, drinking, smoking or going to the toilet. Avoid touching your skin or eyes with contaminated hands. Clean thoroughly at the end of the workday. Remove and clean contaminated clothing before wearing it again, or discard it.
• Maintenance personnel need to know the possible hazards of the products they might be exposed to.
• Store away from incompatible materials and in a cool, dry, well-ventilated area and out of direct sunlight.
• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  – Know where the closest eyewash station and safety shower are located and how to use them. Flush contaminated eyes or skin with water for the time as recommended on the SDS or as directed by a medical professional. Call immediately for emergency medical assistance.
  – Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, etc.).
  – Ensure that appropriate fire extinguishers are available.
Health Hazards - Serious eye damage/eye irritation

Products that can cause irreversible (permanent) damage to the eyes are category 1. Category 2A is for products that are moderately irritating to the eyes but the damage is reversible. Category 2B is for mild irritants which cause less damage and reversible damage to the eyes.

</tbody>
</table>

Key Precautions

- Understand all of the hazards associated with the product and how to use it safely. Check the Safety Data Sheet (SDS) for information about the hazards and necessary precautions.
- Prevent uncontrolled release (e.g., dust, mist, vapour) into the workplace air.
- Use only in well-ventilated areas. Use the smallest amount necessary.
- Inspect containers for damage or leaks before handling.
- Wear appropriate eye protection or goggles to avoid contact with product. A faceshield may be necessary. If PPE is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
- Open containers slowly and carefully. Dispense carefully and keep containers closed when not in use. Clean up any spills or dust buildup promptly and safely.
• Wash hands before eating, drinking, smoking or going to the toilet. Avoid touching yourself with contaminated hands. Clean yourself thoroughly at the end of the workday.
• Maintenance personnel need to know the possible hazards of the products they might be exposed to.
• Store away from incompatible materials and in a cool, dry, well-ventilated area and out of direct sunlight.
• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  – Know where the closest eyewash station and safety shower are located and how to use them. Flush contaminated eyes or skin with water for the time as recommended on the SDS or as directed by a medical professional. Call immediately for emergency medical assistance.
  – Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, etc.).
  – Ensure that appropriate fire extinguishers are available.
Health Hazards - Respiratory or skin sensitization: respiratory sensitizer

Sensitization is an allergic response by the body’s immune system. Sensitization is a “whole-body” allergic response. It differs from irritation which is a “localized” response (irritation occurs where contact with the irritant occurs). Responses to sensitizers vary. Some people will never become sensitized, others may become sensitized after a single exposure. Once a person has been sensitized, their body will respond to that sensitizer very quickly again when exposed to it (even if the dose is much smaller than the original dose that sensitized them).

Initial symptoms of exposure to respiratory sensitizer can seem like a cold or hay fever (including sneezing, runny nose, headache). Symptoms can progress to more severe asthma-like symptoms such as coughing, wheezing, chest tightness, shortness of breath and difficulty breathing. With continued exposure and without proper medical attention, these symptoms can be potentially fatal.

Examples of respiratory sensitizers include: latex, many metals (such as chromium, cobalt, nickel, or zinc), acid anhydrides, various acrylates, isocyanates (such as HDI, TDI, MDI), styrene.

Table 29: Respiratory or skin sensitizers: respiratory sensitizer

<td>May cause allergy or asthma symptoms or breathing difficulties if inhaled</td>
</tr>
</tbody>
</table>

Key Precautions

- Understand all of the hazards associated with the product and how to use it safely. Check the label and SDS for information about the hazards and necessary precautions.
- Avoid using potential respiratory sensitizers if possible. Try to eliminate or substitute with a less hazardous product.
- Prevent uncontrolled release (e.g., dust, mist, vapour) into the workplace air. Closed handling systems can prevent the release of the products into the workplace. Use only in well-ventilated areas. Use the smallest amount necessary.
- Unprotected persons should avoid all contact with products classified as respiratory sensitizers. Use appropriate engineering controls.
- Be aware of the typical symptoms of an allergic reaction and know the appropriate first aid procedures. Report any signs of illness or exposure concerns to your supervisor immediately.
- Wear appropriate personal protective equipment (PPE). This equipment may include respiratory protection, goggles, face shield and gloves. If PPE is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
• Report leaks, spills or ventilation failures immediately. Put on a suitable respirator immediately in the event that a respiratory sensitizer is released into the workplace.

• Inspect containers for damage or leaks before handling.

• Open containers slowly and carefully. Dispense carefully and keep containers closed when not in use. Clean up any spills or dust buildup promptly and safely.

• Wash hands before eating, drinking, smoking or going to the toilet. Avoid touching your skin or eyes with contaminated hands. Clean your skin thoroughly at the end of the workday. Remove contaminated clothing promptly and store in a closed container. Discard, or decontaminate and launder contaminated clothing before rewearing.

• Maintenance personnel need to know the possible hazards of the products they might be exposed to.

• Do not reuse empty containers. Empty containers may contain hazardous residues.

• Store away from incompatible materials and in a cool, dry, well-ventilated area and out of direct sunlight.

• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  – Know where the closest eyewash station and safety shower are located and how to use them.
  – Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, etc.).
  – Ensure that appropriate fire extinguishers are available.

• Be aware that once sensitization has occurred, the individual is usually not able to return to the work environment where the sensitizer is used because of the severity of the body’s response to further exposure.
Health Hazards - Respiratory or skin sensitization: skin sensitizer

Sensitization is an allergic response by the body’s immune system. Sensitization is a “whole-body” allergic response. It differs from irritation which is a “localized” response (irritation of skin occurs where contact with the irritant occurs). Responses to sensitizers vary. Some people will never be sensitized, others may become sensitized after a single exposure. Once a person has been sensitized, their body will respond to that sensitizer very quickly again when exposed to it (even if the dose is much smaller than the original dose that sensitized them).

Skin sensitizers can cause an allergic reaction with symptoms such as redness, rash, itching, swelling or blisters. These symptoms may occur at the point on contact with the sensitizer or it could occur elsewhere on the body.

Examples of skin sensitizers include: latex, methyl methacrylate, toluene diisocyanate (TDI). Read the SDS thoroughly to understand what you are working with.

Key Precautions

- Understand all of the hazards associated with the product and how to use it safely. Check the label and SDS for information about the hazards and necessary precautions.
- Avoid using potential skin sensitizers if possible. Try to eliminate or substitute with a less hazardous product.
- Prevent uncontrolled release (e.g., dust, mist, vapour) into the workplace air. Use appropriate engineering controls. Closed handling systems can prevent the release of the materials into the workplace. Use only in well-ventilated areas. Use the smallest amount necessary.
- Be aware of the typical symptoms of an allergic response and know the appropriate first aid procedures. Report any signs of illness or exposure concerns to the supervisor immediately.
- Wear appropriate personal protective equipment (PPE), if necessary, to avoid all contact with sensitizers. This equipment may include protective clothing, respiratory protection, goggles, face shield and gloves. If PPE is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
- Report leaks, spills or ventilation failures immediately.
- Inspect containers for damage or leaks before handling.
- Open containers slowly and carefully. Dispense carefully and keep containers closed when not in use. Clean up any spills or dust buildup promptly and safely.
• Wash hands before eating, drinking, smoking or going to the toilet. Avoid touching your skin with contaminated hands. Clean your skin thoroughly at the end of the workday. Remove contaminated clothing promptly and store in a closed container. Discard, or decontaminate and launder contaminated clothing before rewearing.

• Maintenance personnel need to know the possible hazards of the products they might be exposed to.

• Do not reuse empty containers. Empty containers may contain hazardous residues.

• Store away from incompatible materials and in a cool, dry, well-ventilated area and out of direct sunlight.

• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  – Know where the closest eyewash station and safety shower are located and how to use them. Flush contaminated eyes or skin with water for the time as recommended on the SDS or as directed by a medical professional. Call immediately for emergency medical assistance.
  – Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, etc.).
  – Ensure that appropriate fire extinguishers are available.

• Be aware that once sensitization has occurred, the individual is often not able to return to the work environment where the sensitizer is used because of the severity of the body’s response to further exposure.
Health Hazard - Germ cell mutagenicity

Germ cells are the specialized cells involved in reproduction. Germ cells carry the genetic material that is passed on to future generations. For these cells to reproduce, there needs to be genetic information from the male (sperm) and the female (egg). Damage to the germ cells can have an impact on the genetic information passed to an unborn child. This change could result in illness or malformations depending on the genetic changes that occur.

This hazard class defines a genetic mutation as a permanent change to the genetic material that is passed on to future children. Read the SDS carefully to ensure that you understand the nature of the hazard.

Key Precautions

- Understand all of the hazards associated with the product and how to use it safely. Check the label and SDS for information about the hazards and necessary precautions.
- Avoid using potential mutagens if possible. Look for a less hazardous substitute.
- Prevent uncontrolled release (e.g., dust, mist, vapour) into the workplace air. Use appropriate engineering controls. Closed handling systems can prevent the release of the products into the workplace. Use only in well-ventilated areas. Use the smallest amount necessary.
- Restrict access to areas where these products are used. Post warning signs.
- Wear appropriate personal protective equipment (PPE), if necessary, to avoid all contact, including contaminated equipment. This equipment may include protective clothing, respiratory protection, goggles, face shield and gloves. If PPE is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
- Inspect containers for damage or leaks before handling. Open containers slowly and carefully. Dispense carefully and keep containers closed when not in use.
• Clean up any spills or dust buildup promptly and safely. Avoid dry mopping/dry sweeping if product can get airborne. Wet mopping or a vacuum cleaner equipped with a HEPA filter should be used.

• Wash hands before eating, drinking, smoking or going to the toilet. Avoid touching your skin and eyes with contaminated hands. Clean thoroughly at the end of the workday. Remove contaminated clothing promptly and store in a closed container. Discard, decontaminate or launder contaminated clothing before rewear.

• Report leaks, spills or ventilation failures immediately.

• Maintenance personnel need to know the possible hazards of the products they might be exposed to.

• Do not reuse empty containers. Empty containers may contain hazardous residues.

• Store away from incompatible materials and in a cool, dry, well-ventilated area and out of direct sunlight.

• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  – Know where the closest eyewash station and safety shower are located and how to use them. Flush contaminated eyes or skin with water for the time as recommended on the SDS or as directed by a medical professional. Call immediately for emergency medical assistance.
  – In the event of exposure, move to fresh air. Alert others of potential exposure.
  – Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, etc.).
Health Hazards - Carcinogenicity

Agents that cause cancer or increase the risk of cancer are called carcinogens. Carcinogens can enter the body through the skin, lungs, or the digestive system. They can interact with the body directly (e.g., at the site of contact) or indirectly (the body transports, or converts the chemical substance into a carcinogen, that may impact other sites of the body that did not have initial contact). Examples of direct carcinogens are the skin cancers associated with coke oven emissions or from ultraviolet light from unprotected sun exposure. Indirect carcinogens include solvents such as benzene (leukemia – blood cancer) and carbon tetrachloride (liver cancer).

The latency, or time for cancer to develop, can vary but in all cases, the effects are not immediate. It may range from 5 years to 20 years or more. There is no known “safe” level that a person can be exposed to for most carcinogens. People react differently and it cannot be predicted. For example, some people smoke multiple packs of cigarettes a day for 20 years but do not develop lung cancer yet others may smoke fewer cigarettes over a short time and develop cancer. Because of this variability, carcinogen exposure should be avoided or kept to the lowest level possible.

Key Precautions

- Understand all of the hazards associated with the product and how to use it safely. Check the label and SDS for information about the hazards and necessary precautions.
- Avoid using potential carcinogens if possible. Use a less hazardous substitute.
- Prevent uncontrolled release (e.g., dust, mist, vapour) into the workplace air. Use appropriate engineering controls. Closed handling systems can prevent the release of the materials into the workplace. Use only in well-ventilated areas. Use the smallest amount necessary.
- Restrict access to areas where these products are used. Post warning signs.
• Wear appropriate personal protective equipment (PPE), if necessary, to avoid all contact. This equipment may include protective clothing, respiratory protection, goggles, face shield and gloves. If PPE is needed, be sure you have the correct training in its selection, use, fit, and maintenance.

• Inspect containers for damage or leaks before handling. Open containers slowly and carefully. Dispense carefully and keep containers closed when not in use.

• Clean up any spills or dust buildup promptly and safely. Avoid dry mopping/dry sweeping if product can get airborne. Wet mopping or a vacuum cleaner equipped with a HEPA filter should be used.

• Wash hands before eating, drinking, smoking or going to the toilet. Avoid touching your skin with contaminated hands. Clean your skin thoroughly at the end of the workday. Remove contaminated clothing promptly and store in a closed container. Discard or decontaminate and launder contaminated clothing before rewearring.

• Report leaks, spills or ventilation failures immediately.

• Maintenance personnel need to know the possible hazards of the products they might be exposed to.

• Do not reuse empty containers. Empty containers may contain hazardous residues.

• Store away from incompatible materials and in a cool, dry, well-ventilated area and out of direct sunlight.

• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  – Know where the closest eyewash station and safety shower are located and how to use them. Flush contaminated eyes or skin with water for the time as recommended on the SDS or as directed by a medical professional. Call immediately for emergency medical assistance.
  – In the event of exposure, move to fresh air. Alert others of potential exposure.
  – Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, etc.)
Health Hazards - Reproductive toxicity

This hazard class includes products that may damage or are suspected of damaging fertility or the unborn child (baby). Note: There is an additional category which includes products that may cause harm to breast-fed children.

Table 33: Reproductive toxicity

Key Precautions

- Understand all of the hazards associated with the product and how to use it safely. Check the label and SDS for information about the hazards and necessary precautions.
- Avoid using potential reproductive toxicity products if possible. Use a less hazardous substitute.
- Prevent uncontrolled release (e.g., dust, mist, vapour) into the workplace air. Use appropriate engineering controls. Closed handling systems can prevent the release of the materials into the workplace. Use only in well-ventilated areas. Use the smallest amount necessary.
- Restrict access to areas where these products are used. Post warning signs.
- Wear appropriate personal protective equipment (PPE), if necessary, to avoid all contact. This equipment may include protective clothing, respiratory protection, goggles, face shield and gloves. If PPE is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
• Inspect containers for damage or leaks before handling. Open containers slowly and carefully. Dispense carefully and keep containers closed when not in use.

• Clean up any spills or dust buildup promptly and safely. Avoid dry mopping/dry sweeping if material can get airborne. Wet mopping or a vacuum cleaner equipped with a HEPA filter should be used.

• Wash hands before eating, drinking, smoking or going to the toilet. Avoid touching your skin and eyes with contaminated hands. Clean yourself thoroughly at the end of the workday. Remove contaminated clothing promptly and store in a closed container. Discard, or decontaminate and launder contaminated clothing before rewearng.

• Report leaks, spills or ventilation failures immediately.

• Maintenance personnel need to know the possible hazards of the products they might be exposed to.

• Do not reuse empty containers. Empty containers may contain hazardous residues.

• Store away from incompatible materials and in a cool, dry, well-ventilated area and out of direct sunlight.

• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  – Know where the closest eyewash station and safety shower are located and how to use them. Flush contaminated eyes or skin with water for the time as recommended on the SDS or as directed by a medical professional. Call immediately for emergency medical assistance.
  – In the event of exposure, move to fresh air. Alert others of potential exposure.
  – Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, etc.).
Health Hazards - Specific target organ toxicity - Single exposure (STOT– Single)

This hazard class includes products in which a single exposure can cause significant, non-lethal damage to organs. Target organs or systems that can be affected include the liver (caused by hepatotoxins), kidneys (caused by nephrotoxins), the nervous system (caused by neurotoxins), as well as damage to the blood, lungs or skin. Read the SDS and label thoroughly to understand the hazards of the product you are using.

In addition, products that may cause respiratory tract irritation and/or drowsiness or dizziness are covered in this class.

Key Precautions

- Understand all of the hazards associated with the product and how to use it safely. Check the label and SDS for information about the hazards and necessary precautions.
- Avoid using these products if possible. Use a less hazardous substitute.
• Prevent uncontrolled release (e.g., dust, mist, vapour) into the workplace air. Use appropriate engineering controls. Use only in well-ventilated areas. Use the smallest amount necessary.

• Wear appropriate personal protective equipment (PPE), if necessary, to avoid contact. This equipment may include protective clothing, respiratory protection, goggles, face shield and gloves. If PPE is needed, be sure you have the correct training in its selection, use, fit, and maintenance.

• Inspect containers for damage or leaks before handling. Open containers slowly and carefully. Dispense carefully and keep containers closed when not in use.

• Clean up any spills or dust buildup promptly and safely. Avoid dry mopping/dry sweeping if product can get airborne. Wet mopping or a vacuum cleaner equipped with a HEPA filter should be used.

• Wash hands before eating, drinking, smoking or going to the toilet. Avoid touching your skin and eyes with contaminated hands. Clean skin thoroughly at the end of the workday. Remove contaminated clothing promptly and store in a closed container. Discard, decontaminate, or launder contaminated clothing before rewearing.

• Maintenance personnel need to know the possible hazards of the products they might be exposed to.

• Do not reuse empty containers. Empty containers may contain hazardous residues.

• Store away from incompatible materials and in a cool, dry, well-ventilated area and out of direct sunlight.

• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  – Know where the closest eyewash station and safety shower are located and how to use them. Flush contaminated eyes or skin with water for the time as recommended on the SDS or as directed by a medical professional. Call immediately for emergency medical assistance.
  – Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, etc.)
Health Hazards - Specific target organ toxicity - repeated exposure (STOT – repeated)

This hazard class covers products that cause or may cause damage to organs (e.g., liver, kidneys, or blood) following prolonged or repeated exposure. Target organs or systems that can be affected include the liver (caused by hepatoxins), kidneys (caused by nephrotoxins), the nervous system (caused by neurotoxins), as well as damage to the blood, lungs or skin. Read the SDS and label thoroughly to understand the hazards of the product you are using.

Key Precautions

- Understand all of the hazards associated with the product and how to use it safely. Check the label and SDS for information about the hazards and necessary precautions.
- Avoid using these products if possible. Use a less hazardous substitute.
- Prevent uncontrolled release (e.g., dust, mist, vapour) into the workplace air. Use appropriate engineering controls. Use only in well-ventilated areas. Use the smallest amount necessary.
- Wear appropriate personal protective equipment, if necessary, to avoid contact. This equipment may include protective clothing, respiratory protection, goggles, face shield and gloves. If PPE is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
- Inspect containers for damage or leaks before handling. Open containers slowly and carefully. Dispense carefully and keep containers closed when not in use.
- Clean up any spills or dust buildup promptly and safely. Avoid dry mopping/dry sweeping if product can get airborne. Wet mopping or a vacuum cleaner equipped with a HEPA filter should be used.
• Wash hands before eating, drinking, smoking or going to the toilet. Avoid touching your skin or eyes with contaminated hands. Clean thoroughly at the end of the workday. Remove contaminated clothing promptly and store in a closed container. Discard, decontaminate, or launder contaminated clothing before rewearing.

• Maintenance personnel need to know the possible hazards of the products they might be exposed to.

• Do not reuse empty containers. Empty containers may contain hazardous residues.

• Store away from incompatible materials and in a cool, dry, well-ventilated area and out of direct sunlight.

• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  – Know where the closest eyewash station and safety shower are located and how to use them. Flush contaminated eyes or skin with water for the time as recommended on the SDS or as directed by a medical professional. Call immediately for emergency medical assistance.
  – Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, etc.).
Health Hazards - Aspiration hazard

Aspiration occurs when a liquid or solid enters the trachea (windpipe) and lower respiratory system (lungs). The product can enter or be aspirated directly through the nose or mouth or it may enter indirectly as a result of vomiting.

The primary factor that determines the risk of aspiration is viscosity or whether the liquid is “thin” (more like water) or “thick” (more like honey). Low viscosity hydrocarbons (e.g., “thin” like turpentine and gasoline) can enter the lungs easily. Common aspiration hazards are petroleum distillates which includes straight-chain hydrocarbons (e.g., hexane, octane, gasoline) and aromatic hydrocarbons (e.g., kerosene). Other examples include pine oils, turpentine, paint thinners and mineral oils.

Product aspirated into the lungs can cause significant health effects because it can spread very quickly and coat the lung tissue. This spread of product can irritate the tissues causing coughing, shortness of breath and wheezing. It may cause symptoms such as chills and fever as it progresses. One of the serious effects of aspirated products is the development of chemical pneumonia (fluid in the lungs). The impacts of aspiration hazards can be delayed so if an exposure if suspected, get medical help quickly so preventive treatment can begin.

Table 36: Aspiration hazard

Key Precautions

- Understand all of the hazards associated with the product and how to use it safely. Check the label and SDS for information about the hazards and necessary precautions.
- Avoid using these products if possible. Look for a less hazardous substitute.
- Prevent uncontrolled release (e.g., dust, mist, vapour) into the workplace air. Use appropriate engineering controls. Use only in well-ventilated areas. Use the smallest amount necessary.
- Wear appropriate personal protective equipment, if necessary, to avoid contact. This equipment may include protective clothing, respiratory protection, goggles, face shield and gloves. If PPE is needed, be sure you have the correct training in its selection, use, fit, and maintenance.
- Inspect containers for damage or leaks before handling. Open containers slowly and carefully. Dispense carefully and keep containers closed when not in use.
- Clean up any spills or dust buildup promptly and safely. Avoid dry mopping/dry sweeping if product can get airborne. Wet mopping or a vacuum cleaner equipped with a HEPA filter should be used.
• Wash hands before eating, drinking, smoking or going to the toilet. Avoid touching your skin or eyes with contaminated hands. Clean thoroughly at the end of the workday. Remove contaminated clothing promptly and store in a closed container. Discard, decontaminate, or launder contaminated clothing before rewearing.

• Maintenance personnel need to know the possible hazards of the products they might be exposed to.

• Do not reuse empty containers. Empty containers may contain hazardous residues.

• Store away from incompatible materials and in a cool, dry, well-ventilated area and out of direct sunlight.

• Understand and practice emergency procedures so that you know what to do if it becomes necessary.
  – In the event of exposure, move to fresh air. Alert others of potential exposure.
  – Do not induce vomiting as this action is an aspiration hazard.
  – Effects of exposure may be delayed by up to 24 hours. Seek medical attention after a known exposure even if no symptoms are felt.
  – Ensure that eyewash and emergency shower are readily available in the immediate work area. These devices must be tested regularly.
  – Know where the closest eyewash station and safety shower are located and how to use them. Flush contaminated eyes or skin with water for the time as recommended on the SDS or as directed by a medical professional. Call immediately for emergency medical assistance.
  – Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, etc.).
Health Hazards - Biohazardous infectious materials

This class is specific to WHMIS. These materials are microorganisms, nucleic acids or proteins that cause or is a probably cause of infection, with or without toxicity, in humans or animals.

Biohazardous infectious materials require very specific handling and storage precautions and are generally beyond the scope of this course. These materials are not common in most workplaces. Using these materials requires extensive training and controls.

Key Precautions

- Understand ALL of the hazard associated with the product and how to use it safely. Read the label and SDS thoroughly.
Health Hazards - Health Hazards Not Otherwise Classified (HHNOC)

This class is specific to WHMIS. This class covers products that are not included in any other health hazard class and have the characteristic of occurring following acute or repeated exposure and having an adverse effect on the health of a person exposed to it, including an injury, or resulting in the death of that person. If a product is classified in this class, the hazard statement will describe the nature of the hazard.

Key Precautions

- Understand ALL of the hazard associated with the product and how to use it safely. Read the label and SDS thoroughly.
Environmental Hazards - Hazardous to the aquatic environment - short-term (acute) (not mandatory)

WHMIS did not adopt the GHS environment classes, but it is possible you will see these pictograms. This hazard class covers products that can have a negative effect on the environment. These products use the environmental hazard pictogram. If the product only has this pictogram, the primary concern is its toxicity for aquatic life. If the product using this pictogram is also potentially hazardous to humans (e.g., physical or health hazards) it would have the other hazard pictograms to warn about its other properties.

This class includes products that can cause short-term (acute) effects on various life forms in the aquatic environment such as fish, crustaceans, algae and aquatic plants.

Table 39: Hazardous to the aquatic environment - short-term (acute)

</tbody>
</table>

Key Precautions

- Understand all of the hazards associated with the product and how to use it safely. Check the label and SDS for information about the hazards and necessary precautions.
- Use the smallest amount necessary.
- Dispose of product properly as hazardous waste – not down the drain.
- Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, etc.). Contain spill quickly by diking with spill socks or suitable absorbent material (kitty litter, vermiculite, etc.). Do not leave spill site unattended.
- Prevent product from contaminating ground water, surface waters and sewer system. Protect floor drains, cover opening to sewer if able to do so.
• Report leaks, spills to the people responsible for handling emergencies where you work.
• Store substance in a secure, dry, well-ventilated location. Storage area should have sills and prevent leaks and spills from escaping to sewers.
• Regularly inspect and maintain the equipment used for handling the substance.
• Use secondary containment for containers such as drip trays to contain leaks or spills. Empty trays regularly to avoid overflow. Monitor use of product. Unexpected increased use of overflow trays may indicate a leak.
• Isolate loading and unloading areas from surface water drainage systems. If not possible, protect drains using covers, sandbags, etc.
• Maintenance personnel need to know special procedures and precautions that might be needed before they begin to work on equipment.
• Be aware of applicable legislation in your jurisdiction concerning products that are hazardous to the environment (e.g., permits).
• Follow recommendations found on the SDS.
**Hazardous to the aquatic environment - Long-term (chronic)**

(not mandatory)

WHMIS did not adopt the GHS environment classes, but it is possible you will see these pictograms.

This hazard class covers products that can have long-term negative impacts on the environment. These products use the environmental hazard pictogram. If the product only has this pictogram, the main concern is its impact on aquatic life. If the product using this pictogram is also potentially hazardous to humans in the workplace (e.g., physical or health hazards), it would have other hazard pictograms to warn about its other properties.

This class addresses the long-term (chronic) impacts of products on the aquatic environment. In this case, the bioaccumulation and degradation impacts on various life forms in the aquatic environment are studied (such as fish, crustaceans, algae and aquatic plants). Bioaccumulation refers to the accumulation of a substance in aquatic organisms. The bioaccumulation may or may not have a toxic effect on some organisms but it is a concern because when other organisms eat smaller organisms (e.g., accumulates in algae; little fish eat algae; big fish eats little fish), they accumulate more of the substance. Eventually the levels can exert a negative impact. Degradation of the substance refers to whether the product breaks down quickly or whether it is persistent and remains in the environment. Examples of the impacts include reduced spawning, genetic problems in offspring, and behavioural changes.

**Table 40: Hazardous to the aquatic environment - Long-term (chronic)**

Key Precautions

- Understand all of the hazards associated with the product and how to use it safely. Check the label and SDS for information about the hazards and necessary precautions.
- Use the smallest amount necessary.
- Dispose of product properly as hazardous waste – not down the drain.
- Have spill control procedures and equipment ready (e.g., absorbent spill control materials, PPE, etc.). Contain spill quickly by diking with spill socks or suitable absorbent material (kitty litter, vermiculite, etc.). Do not leave spill site unattended.
- Prevent product from contaminating ground water, surface waters and sewer system. Protect floor drains, cover opening to sewer if able to do so.
- Report leaks, spills to the people responsible for handling emergencies where you work.
- Store substance in a secure, dry, well-ventilated location. Storage area should have sills and prevent leaks and spills from escaping to sewers.
- Regularly inspect and maintain the equipment used for handling the substance.
- Use secondary containment for containers such as drip trays to contain leaks or spills. Empty trays regularly to avoid overflow. Monitor use of product. Unexpected increased use may indicate leakage.
- Isolate loading and unloading areas from surface water drainage systems. If not possible, protect drains using covers, sandbags, etc.
- Maintenance personnel need to know special procedures and precautions that might be needed before they begin to work on equipment.
- Be aware of applicable legislation in your jurisdiction concerning products that are hazardous to the environment (e.g., permits).
- Follow recommendations found on the SDS.
Environmental Hazards – Hazardous to the ozone layer (not mandatory)

WHMIS did not adopt this GHS environmental hazard class, but you may see this class indicated on products. Ozone-depleting substances (ODS) are gases which damage the ozone layer in the upper atmosphere. Some ODS also have a global warming potential so they contribute to climate change. Common examples of ODS are: chlorofluorocarbons (CFCs), carbon tetrachloride, hydrochlorofluorocarbons (HCFCs), halons, methyl chloroform and methyl bromide.

Common uses for ODS and fluorinated gases include refrigeration and air-conditioning equipment, aerosols, solvents, foam blowing agents, firefighting fluids, and high voltage switchgear.

Key Precautions

- Understand all of the hazards associated with the product and how to use it safely. Check the label and SDS for information about the hazards and necessary precautions.
- Be aware of applicable legislation in your jurisdiction concerning products that are hazardous to the ozone layer (e.g., environmental permits). Be aware of what products are permitted for use.
- Use the smallest amount necessary. Substitute with a less hazardous product wherever possible. Common alternative refrigerants include ammonia, carbon dioxide, propane and butane.
- Only use the permitted refrigerants when servicing.
- Ensure that ODS are properly recovered when servicing, maintaining and decommissioning equipment. Ensure that only those properly trained and qualified perform service on the equipment.
- Consider automatic leak detection systems for larger quantities.
- Maintenance personnel need to know special procedures and precautions that might be needed before they begin to work on equipment.
- Regularly inspect and maintain equipment and storage area and for signs of leakage or damage. Repair as soon as possible. Follow up to ensure that leaks have been securely contained.
- Maintain records – quantities used, amounts lost, added or recovered, dates for inspection/maintenance etc.
- Ensure that systems containing these products are properly labelled.
6. Workplace-specific Training

The education covered in this course applies to all workplaces. Workplace-specific training is just what the name suggests: it is customized for a specific workplace. For example, the workplace-specific information for places such as a bakery, real estate office, veterinary clinic, landscaping business or gas station/garage will have differences. Even similar types of companies, such as two retail stores, will have different answers to the questions.

This next section requires taking this information and applying it to or “personalizing” it for a specific workplace. The questions provided are intended to encourage participants to “own” the information and connect it to their workplace. It also provides the trainer with an opportunity to assess how well the participants understand the material taught. This next section will outline the typical requirements for workplace-specific training.

NOTE: CCOHS can provide guidance on what might be covered by this aspect of training but it is important to understand that the employer or trainer must customize it accordingly to match the workplace needs.

As the trainer, you may be able to assist in answering some or all of the questions related to workplace-specific aspects about WHMIS and chemical safety. If not, consider asking a supervisor or manager to assist by providing correct answers beforehand or during the session. This approach reinforces to the participants that workplace health and safety is not just for “workers” but involves everyone in the workplace.

According to Saskatchewan OH&S legislation, your employer must:

- Inform you about all hazard information concerning the specific hazardous products in your workplace.
- Educate and train you to be able to apply this hazard information to protect your health & safety.
- Consult with your OHC about this education & training program.
- Periodically test your knowledge in WHMIS.
- Annually review WHMIS education & training program with the OHC or when changes occur in workplace conditions and/or hazard information.

This means you can expect to see in your site-specific WHMIS program at your workplace:

- An inventory of all hazardous products in your worksite. This means the employer should keep readily available to you a listing of all the hazardous products. Generally, this is kept in the front of an SDS binder or as a table of contents in an electronic folder. It is recommended upon annual review, the inventory be updated and revised, if necessary.
- Education & training regarding the hazardous products specific to your workplace. It is essential workers receive training on the specific hazardous products they will be exposed to or come into contact with in the course of their daily work activities. While a generic WHMIS course will provide education for the worker...
about the general aspects of WHMIS, it cannot be substituted as site-specific WHMIS training as performed by the employer.

- Documented procedure(s) to be followed in case of an emergency with a hazardous product. These emergency procedures should stem directly from emergency response information as listed within a hazardous product’s SDS.
- A written test or sign-off of practical demonstration of your site-specific WHMIS knowledge performed on a periodic basis. Documentation indicating employees have received site-specific knowledge on the hazardous products in their workplace and can demonstrate this through a written test or practical demonstration or other means helps an employer’s due diligence with The Right to Know.
- Appropriate SDSs be readily available to you by electronic and/or print at all times. “Readily available” is defined as present in an appropriate place, accessible to a worker at all times, and in the form of: (a) a physical copy; or (b) an electronic copy.

**What to include in workplace-specific training**

As a starting point, recall the four questions that test how well a worker understands the hazards of the product(s) they use. These questions help focus attention on the most important concepts, and will identify what workplace-specific training needs are required.

- What are the hazards of the product?
  - The worker should be able to read and understand the label and SDS as well as be aware of any possible harmful effects of the product used.
- How are you protected from those hazards?
  - An understanding of the controls used in the workplace is necessary whether these controls are accomplished by engineering controls, administration, or by using personal protective equipment (PPE).
- What do you do in case of an emergency?
  - Understanding the procedures to follow in the event of a spill, release, fire or poisoning involving a hazardous product is required. Included in the understanding is the use of personal protective equipment that may be necessary only in the case of emergency.
- Where can you get hazard information?
  - Workers should demonstrate that they know how to get the information provided by the labels and SDSs. They should know about the supplier and workplace labels and other ways used to identify the products and what these labels mean. They must also know how to get the SDS (either by the binder location or by accessing a computer) so that they have a way to get information significant to his or her health and safety.

The following activity will get participants to look at the answers to these questions for products in their workplace.
ACTIVITY: Workplace-specific worksheet

This group activity will help workers apply knowledge of WHMIS and workplace-specific health and safety requirements to their actual workplace. Four participants per group are recommended.

Instruct the groups to work through the following worksheet. Allow about 5-10 minutes to answer the questions. Encourage them to fill in as much as possible. They may not know all the answers right away but as the trainer reviews the responses, they can fill in the ones they missed. The worksheet can then be used as a resource for them when they go back into their work area.

Trainer tip:

To get the most out of this activity, check with the supervisor(s) before this activity and get as much of this information as possible before the session. For example, have copies of the SDSs for the products used by that workplace or unit, or area (labels also if possible). Many answers are workplace specific (e.g., location of fire extinguishers, or types of controls used). Prepare ahead of time – the trainer should know the answers to be able to confirm that all participants can complete their worksheets properly.

Appendix B: Sample SDS for Group Activity

SDS for Cleans SUPER Great

Sample Safety Data Sheet
(for illustrative purposes only)

Cleans SUPER Great

SECTION 1. IDENTIFICATION
Product Identifier: Cleans SUPER Great
Other Means of Identification: ID-999
Recommended Use: Concentrated cleaner.
Restrictions on Use: None.
Manufacturer / Supplier: ABZ Company, 123-5th Street, Anywhere, Ontario, NON 0NO
Emergency Phone No.: E. Responder, 555-222-3333, 24/7
SDS No.: 0164
Date of Preparation: February 02, 2014

SECTION 2. HAZARDS IDENTIFICATION
Classification:
Flammable liquid - Category 2; Eye irritation - Category 2A; Skin sensitization - Category 1;
Specific target organ toxicity single exposure - Category 3; Aspiration hazard - Category 1

Label Elements:
Pictogram: Flame, Exclamation mark, Health hazard
Signal Word: Danger

Hazard Statement(s):
Highly flammable liquid and vapour.
Causes serious eye irritation.
May cause an allergic skin reaction.
May cause drowsiness or dizziness.
May be fatal if swallowed and enters airways.

Precautionary Statement(s):
Prevention:
Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. No smoking.
Keep container tightly closed.
Ground and bond container and receiving equipment.
Use explosion-proof electrical, ventilating, lighting, and other equipment.
Use non-sparking tools.
Take action to prevent static discharges.
Avoid breathing mist, vapours, spray.
Wash hands and skin thoroughly after handling.
Use only outdoors or in a well-ventilated area.
Contaminated work clothing should not be allowed out of the workplace.
Wear protective gloves, protective clothing, eye protection and face protection.

Response:
IF INHALED: Remove person to fresh air and keep comfortable for breathing. Call a POISON CENTRE or doctor if you feel unwell.

Product Identifier: Cleans SUPER Great
Date of Preparation: February 02, 2014
SDS for Cleans SUPER Great cont’d

IF ON SKIN (or hair): Take off immediately all contaminated clothing and wash it before re-use. Wash skin with plenty of water. If skin irritation or rash occurs: Get medical advice or attention.

IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. If eye irritation persists: Get medical advice or attention.

IF SWALLOWED: Immediately call a POISON CENTRE or doctor. Do NOT induce vomiting.

In case of fire: Use carbon dioxide, dry chemical powder, appropriate foam to extinguish.

Storage:
Store locked up.
Keep container tightly closed.
Store in a well-ventilated place. Keep cool.

Disposal:
Dispose of contents and container in accordance with local, regional, national and international regulations.

Other Hazards
None known.

SECTION 3. COMPOSITION/INFORMATION ON INGREDIENTS

<table>
<thead>
<tr>
<th>Chemical Name</th>
<th>CAS No.</th>

</tbody>
</table>

Notes
*CSI, under review. CSI = Confidential Business Information. HMIRA Registration No.: 1234. Filing Date: January 04 2012. (Terpine) Concentrations are expressed in % volume/volume.

SECTION 4. FIRST-AID MEASURES

First-aid Measures
Inhalation
Move to fresh air. Keep at rest in a position comfortable for breathing. Call a Poison Centre or doctor if you feel unwell or are concerned.

Skin Contact
Take off contaminated clothing, shoes and leather goods (e.g. watchbands, belts). Immediately rinse with lukewarm, gently flowing water for 15-20 minutes. If skin irritation or a rash occurs, get medical advice/attention. Thoroughly clean clothing, shoes and leather goods before reuse or dispose of safely.

Eye Contact
Immediately rinse the contaminated eye(s) with lukewarm, gently flowing water for 15-20 minutes, while holding the eyelid(s) open. Take care not to rinse contaminated water into the unaffected eye or onto the face. Remove contact lenses, if present and easy to do. If eye irritation persists: Get medical advice/attention.

Ingestion
Immediately call a Poison Centre or doctor. Do not induce vomiting.

Most Important Symptoms and Effects, Acute and Delayed
If inhaled: at high concentrations symptoms may include headache, nausea, dizziness, drowsiness and confusion. If on skin: may cause an allergic skin reaction in some people. Symptoms include redness, rash, itching and swelling.

Product Identifier: Cleans SUPER Great
Date of Preparation: February 02, 2014
SDS for Cleans SUPER Great cont’d

If in eyes: symptoms include sore, red eyes, and tearing.
If swallowed: may be drawn into the lungs if swallowed or vomited, causing severe lung damage. Symptoms may include coughing, shortness of breath, difficult breathing and tightness in the chest.

Immediate Medical Attention and Special Treatment
Special Instructions
Not applicable.

SECTION 5. FIRE-FIGHTING MEASURES
Extinguishing Media

Suitable Extinguishing Media
Carbon dioxide, dry chemical powder or appropriate foam. Use water to keep non-leaking, fire-exposed containers cool.

Unsuitable Extinguishing Media
Water is not effective for extinguishing a fire. It may not cool product below its flash point.

Specific Hazards Arising from the Chemical
Highly flammable liquid and vapour. Can ignite at room temperature. Releases vapour that can form explosive mixture with air. Can be ignited by static discharge.
May travel a considerable distance to a source of ignition and flash back to a leak or open container. May accumulate in hazardous amounts in low-lying areas especially inside confined spaces, resulting in a fire and/or health hazard.
Closed containers may rupture violently when heated releasing contents.
In a fire, the following hazardous materials may be generated: very toxic carbon monoxide, carbon dioxide. As well, other toxic and irritating compounds, such as formaldehyde, methanol, acetic acid, hydrogen peroxide, methane and ethylene oxide may be formed, depending on fire conditions.

Special Protective Equipment and Precautions for Fire-fighters
Evacuate area. Approach fire from upwind to avoid hazardous vapours or gases.
Stop leak before attempting to put out the fire. Product could form an explosive mixture and reignite. Keep containers cool to avoid bursting.
Before entry, especially into confined areas, use an appropriate monitor to check for toxic gases or vapours, flammable or explosive atmosphere.
Dike and recover contaminated water for appropriate disposal.
Fire-fighters may enter the area if positive pressure SCBA and full Bunker Gear is worn. If there is potential for skin contact with concentrated cleaner, chemical protective clothing (e.g. chemical splash suit) and positive pressure SCBA may be necessary. See Skin Protection in Section 6 (Exposure Controls/Personal Protection) for advice on suitable chemical protective materials.

SECTION 6. ACCIDENTAL RELEASE MEASURES
Personal Precautions, Protective Equipment, and Emergency Procedures
Concentrated product, evacuate the area immediately. Isolate the hazard area. Keep out unnecessary and unprotected personnel. Eliminate all ignition sources. Use grounded, explosion-proof equipment. Distant ignition and flashbacks are possible.
Increase ventilation to area or move leaking container to a well-ventilated and secure area. Do not touch damaged containers or spilled product unless wearing appropriate protective equipment. Use the personal protective equipment recommended in Section 8 of this safety data sheet.
Review Section 7 (Handling) of this safety data sheet before proceeding with clean-up.
Before entry, especially into confined areas, check atmosphere with an appropriate monitor. Monitor area for flammable or explosive atmosphere.

Product (diluted as directed): use the personal protective equipment recommended in Section 8 of this safety data sheet. No other special precautions are necessary.
SDS for Cleans SUPER Great cont’d

Environmental Precautions
Concentrated product: do not allow into any sewer, on the ground, or into any waterway. If the spill is inside a building, prevent product from entering drains, ventilation systems and confined areas.

Methods and Materials for Containment and Cleaning Up
Concentrated product: small spills or leaks: contain and soak up spill with absorbent that does not react with spilled product. Do NOT use combustible materials such as sawdust. Place used absorbent into suitable, covered, labelled containers for disposal.

Concentrated product: large spills or leaks: cover the spill surface with the appropriate type of foam to reduce the release of vapour. Dike spilled product to prevent runoff. Remove or recover liquid using pumps or vacuum equipment. Dike and recover contaminated water for appropriate disposal. Store recovered product in suitable containers that are tightly-covered.

Product (diluted as directed): no special clean-up methods are necessary.

Other Information
Report spills to local health, safety and environmental authorities, as required.

SECTION 7. HANDLING AND STORAGE

Precautions for Safe Handling
When handling concentrated product: no special handling precautions are necessary. When handling concentrated product: only use where there is adequate ventilation. Avoid generating vapours or mists. Keep containers tightly closed when not in use or empty. Electrically bond and ground equipment. Ground clips must contact bare metal. Eliminate heat and ignition sources such as sparks, open flames, hot surfaces and static discharge. Post "No Smoking" signs. Use non-sparking tools. Wear personal protective equipment to avoid direct contact with this chemical.

Do NOT smoke in work areas. Wash hands thoroughly after handling this material. Immediately remove contaminated clothing using the method that minimizes exposure. Keep contaminated clothing under water, in closed containers. Launder clothes before reusing. Inform laundry personnel of product hazard(s). Do not take contaminated clothing home.

Conditions for Safe Storage
Concentrated product: store in an area that is temperature-controlled, well-ventilated, out of direct sunlight and away from heat and ignition sources, in an approved, fire-resistant area, separate from incompatible materials (see Section 10: Stability and Reactivity). Store in a closed container.

Protect from conditions listed in Conditions to Avoid in Section 10 (Stability and Reactivity). Keep amount in storage to a minimum. Avoid bulk storage indoors.

Comply with all applicable health and safety regulations, fire and building codes.

SECTION 8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Consult local authorities for provincial or state exposure limits.

ACGIH® = American Conference of Governmental Industrial Hygienists. TLV® = Threshold Limit Value. TWA = Time-Weighted Average. STEL = Short-term Exposure Limit. A4 = Not classifiable as a human carcinogen.

OSHA = US Occupational Safety and Health Administration. PEL = Permissible Exposure Limit. ACGIH® = ACGIH® Guideline Foundation. WEL™ = Workplace Environmental Exposure Limit.

**Appropriate Engineering Controls**

General ventilation is usually adequate. Provide eyewash and safety shower if contact of spill hazard exists.

When handling large quantities of concentrated product, use local exhaust ventilation and enclose, if necessary, to control amount in the air. Use non-sparking ventilation systems, approved explosion-proof equipment and intrinsically safe electrical systems in areas where this product is used and stored.

**Individual Protection Measures**

**Eye/Face Protection**

Do not get in eyes. Wear chemical safety goggles.

**Skin Protection**

Prevent all skin contact. Wear chemical protective clothing e.g. gloves, aprons, boots.

Suitable materials are: Barrier® (PE/PAR), Silver Shield® (PE/EVAL), Tychem® Responder, Tychem® TK.

The following materials should NOT be used: neoprene rubber, nitrile rubber, polyvinyl alcohol.

**Respiratory Protection**

Not normally required if product is used as directed.

Concentrated product: wear a NIOSH approved air-purifying respirator with an organic vapour cartridge.

For non-routine or emergency situations: wear a NIOSH approved air-purifying respirator with an organic vapour cartridge, or, wear a NIOSH approved self-contained breathing apparatus (SCBA) or supplied air respirator.

**SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES**

**Basic Physical and Chemical Properties**

**Appearance**

Colourless liquid.

**Odour**

Citrus

**Odour Threshold**

Not available

**pH**

Not available

**Melting Point/Freezing Point**

-94.6 °C (estimated) (freezing)

**Initial Boiling Point/Range**

86 °C

**Flash Point**

< -18 °C (closed cup)

**Evaporation Rate**

Not available

**Flammability (solid, gas)**

Not applicable (liquid).

**Upper/Lower Flammability or Explosive Limit**

Not available (upper); Not available (lower)

**Vapour Pressure**

180 mm Hg at 20 °C (Acetone)

**Vapour Density (air = 1)**

> 3 (estimated)

**Relative Density (water = 1)**

0.86 at 20 °C

**Solubility**

Soluble in water

**Partition Coefficient, n-Octanol/Water (Log Kow)**

Not available

**Auto-Ignition Temperature**

Not available

**Decomposition Temperature**

Not available

**Viscosity**

14.2 mm²/s at 40 °C (kinematic)

Product Identifier: Cleans SUPER Great

Date of Preparation: February 02, 2014
SECTION 10. STABILITY AND REACTIVITY
Reactivity
Not reactive. Not sensitive to mechanical impact.

Chemical Stability
Normally stable.

Possibility of Hazardous Reactions
None expected under normal conditions of storage and use.

Conditions to Avoid
Open flames, sparks, static discharge, heat and other ignition sources.

Incompatible Materials
Oxidizing agents (e.g. peroxides), strong bases (e.g. sodium hydroxide), reducing agents (e.g. hydroquinone), Not corrosive to metals.

Hazardous Decomposition Products
During a fire, irritant/toxic gases, such as carbon monoxide, carbon dioxide and other toxic and irritating compounds, such as formaldehyde, methanol, acetic acid, hydrogen peroxide, methane and ethylene oxide may be formed, depending on fire conditions.

SECTION 11. TOXICOLOGICAL INFORMATION
Likely Routes of Exposure
Inhalation; skin contact; eye contact; ingestion.

Acute Toxicity

<table>
<thead>
<tr>
<th>Chemical Name</th>

</tbody>
</table>

Skin Corrosion/Irritation
May cause mild irritation based on information for closely related chemicals.

Serious Eye Damage/Irritation
Animal tests show serious eye irritation, Acetone

STOT (Specific Target Organ Toxicity) - Single Exposure
Inhalation
May cause depression of the central nervous system.

Aspiration Hazard

Product Identifier: Cleans SUPER Great
Date of Preparation: February 02, 2014
SDS for Cleans SUPER Great cont’d

May be drawn into the lungs (aspirated) if swallowed or vomited. Symptoms may include coughing, choking, shortness of breath, difficult or rapid breathing, and wheezing.

**STOT (Specific Target Organ Toxicity) - Repeated Exposure**
Following skin contact: may cause dermatitis.
May cause harmful effects on the kidneys, harmful effects on the liver.

**Respiratory and/or Skin Sensitization**
Not a respiratory sensitizer
Skin sensitizer. May cause an allergic reaction (skin sensitization) based on information for closely related chemicals.

**Carcinogenicity**

<table>

Key to Abbreviations:
IARC = International Agency for Research on Cancer, Group 3 = Not classifiable as to its carcinogenicity to humans.
ACGIH® = American Conference of Governmental Industrial Hygienists. A1 = Not classifiable as a human carcinogen.
NTP = National Toxicology Program.

**Reproductive Toxicity**

**Development of Offspring**
Animal studies show effects on the offspring. However, these effects are only seen with significant toxicity in the mother's. (Acetone)

**Sexual Function and Fertility**
Does not cause effects on sexual function or fertility.

**Germ Cell Mutagenicity**
Not mutagenic.

**Interactive Effects**
No information was located.

**SECTION 12. ECOLOGICAL INFORMATION**
This section is not required by WHMIS.
This section is not required by OSHA.

**SECTION 13. DISPOSAL CONSIDERATIONS**

**Disposal Methods**
Recommended disposal methods are for the product, as sold. (Used material may contain other hazardous contaminants). The required hazard evaluation of the waste and compliance with the applicable hazardous waste laws are the responsibility of the user.

Burn in an approved incinerator according to federal, provincial/state, and local regulations.
Empty containers retain product residue. Follow label warnings even if container appears to be empty. The container for this product can present explosion or fire hazards, even when emptied. Do not cut, puncture, or weld on or near this container.

### ACROSS

1. A ________ statement is a standardized phrase that describes the hazards of the product.

4. The ________ identifier indicates the name of the product.

6. GHS is the ________ harmonized system of classification and labelling.

8. A hazard ________ defines the degree of hazard within a hazard class.

11. ________ statements provide advice for handling and first aid.

14. One of the properties that defines flammable liquid hazards is the ________ point.

16. Hazard ________ define the type or nature of the hazard present.

18. This pictogram represents products that can cause health effects such as chronic (long term) health effects.
2. Safety _____ sheets have 16 sections.
3. The pictogram for the _______ aerosols class is a fire pictogram in the “square on a point” shaped border.
5. The signal words used are ______ and “Warning”.
6. Physical hazards and health hazards are hazard ______.
7. A pictogram with an “O” with flames represents an ________.
9. A _______ word is part of the hazard communication for hazard classes and categories.
10. Suppliers must provide a ______ and SDS for all hazardous products covered by the legislation.
12. Materials that can destroy metal containers are ________.
13. What hazard communication system in Canada has been aligned with GHS?
15. The pictogram for acute toxicity is _______ and crossbones.
17. A health effect that occurs soon after an exposure is an ______ effect.
Appendix C1: WHMIS 2015
Crossword (Answers)

Answer Key:

Across:  1) HAZARD; 4) PRODUCT; 6) GLOBALLY; 8) CATEGORY; 11) PRECAUTIONARY; 14) FLASH; 16) CLASSES; 18) HEALTH

Down:  2) DATA; 3) FLAMMABLE; 5) DANGER; 6) GROUPS; 7) OXIDIZER; 9) SIGNAL; 10) LABEL; 12) CORROSIVE; 13) WHMIS; 15) SKULL; 17) ACUTE
Appendix D: Final Test

Connect the pictogram with the appropriate hazard description.

- Short exposure can cause death
- Health hazard
- May intensify fire
- Gas under pressure
- May be corrosive to metals
- Fire hazard
Connect the term on the left with the most appropriate description.

Multiple Choice

Select the best response:

If you see the flame pictogram, what does this pictogram indicate in most cases? Select the answer that is NOT correct.

☐ Always store the material according to the directions on the label and SDS.
☐ The material should be kept away from flames, heat, sparks or hot surfaces.
☐ The material will catch fire easily at normal temperatures.
☐ Keep ignition sources and fuel sources together.

When you first see a product, what information on the label can you use to help understand what the hazards of a product are?

☐ Read the hazard statements
☐ Understand the pictogram
☐ Check what signal word is present (Danger or Warning).
☐ All of the above.

Benefits of aligning WHMIS with GHS include:

☐ Improved, consistent hazard information
☐ Better emergency response
☐ Easier trade between countries
☐ Reducing costs for suppliers
☐ All of the above

You find a container of a product at work, but the label is missing. What should you do?

☐ Ignore it and walk away.
☐ Go get the supervisor, identify the product together, and replace the label.
☐ Smell it to see what the product is.
☐ All of the above.

Safe handling for gases under pressure includes:

☐ keeping the cylinders in a warm location above 52º C
☐ keeping regulators functional using lubricants and greases
☐ using in a well-ventilated area
☐ moving the cylinder by rolling it
Safe handling for flammable liquids includes:

- using the smallest amount possible for the job
- grounding and bonding containers during dispensing operations
- using flammable liquid safety cans for storing and transferring flammable liquids
- avoid all ignition sources and keeping away from combustible materials
- All of the above

The pictogram, signal word, and hazard statements work together to tell you about:

- The colour and smell of the product.
- The cost of the product.
- How that product is hazardous.
- The three elements have no meaning when placed together.

Acute toxic materials:

- can cause health effects shortly after exposure
- can take years to cause an effect
- will burn your eyes or skin
- All of the above

If you were looking at a label, using the pictogram and hazard statement, which one is the most hazardous in terms of skin corrosion/irritation:

- Danger. Causes severe skin burns and eye damage
- Warning. Causes skin irritation
- Warning. Causes mild skin irritation

A signal word is:

- a phrase that describes the hazard
- a single word used to alert users about the degree of hazard
- a pictogram that represents the hazard
- a sub-category of a hazard class

Regarding labels, when you work with a product, what should you do:

- Check for a label on the product
- Ask the supervisor if unsure of any aspect of its use or storage
- Ask for a new label when the old one cannot be seen or read properly
- All of the above
The four important questions that are answered by the SDS are:
- Identity, supplier, hazards, and first aid.
- Identity, hazards, precautions, and emergency procedures.
- Precautions, emergency, environment, and storage.
- Hazards, transport, location, and supplier.

Reading the SDS before you work with a product is important because:
- It provides more information than the label.
- It is required by the employer.
- The label provides you with the product name and pictogram.
- The SDS provides medical advice.

The exclamation mark pictogram is used for a number of classes and/or categories. Which of the following uses the exclamation mark pictogram?
- Skin irritation (cat. 2).
- Skin sensitizer (cat. 1).
- Acute toxicity (oral) (cat. 4).
- All of the above.

Which is the better answer? SDSs must be:
- Available in paper form.
- Available in electronic form.
- Available in the supervisor’s office.
- Available to all workers in the workplace.
Circle the proper response (True) or (False):

True or False  WHMIS stands for “Workplace Hazardous Materials Information System”

True or False  Elements on a label tell you how hazardous a product is. Categories tell you the degree or severity of the hazard. The categories for flammable liquids are correctly showing most hazardous to least hazardous.
- extremely flammable liquid and vapour (cat 1);
- highly flammable liquid and vapour (cat 2);
- flammable liquid and vapour (cat 3);
- combustible liquid (cat 4)

True or False  The acute toxicity hazard information is shown from most hazardous to least hazardous.
- (no pictogram). Warning. May be harmful if inhaled.
- Exclamation mark. Warning. Harmful if inhaled.
- Skull and crossbones. Danger. Toxic if inhaled.
- Skull and crossbones. Danger. Fatal if inhaled.

True or False  A product can be classified under more than one hazard class.

True or False  The pictogram has a bright yellow circle border.

True or False  In a hazard class, a category 2 is less hazardous than a category 1.

True or False  Danger and Warning are signal words.

True or False  The exclamation mark pictogram is used for flammable hazards.

True or False  A cancer-causing product will have the same hazard pictogram as a respiratory sensitizer so it is important to read the label and SDS for more information.

True or False  The health hazard pictogram represents more serious health impacts than the exclamation mark pictogram.

True or False  The health hazard pictogram represents chronic toxicity hazards.
True or False Gases under pressure can be very cold and direct contact can cause frostbite.

True or False Corrosive materials do not cause health effects. They only cause damage to metals.

True or False WHMIS will no longer exist after GHS comes to Canada.

Thank you.

Do you have any questions about WHMIS 2015 or the workplace-specific training in your workplace that were not answered? Please list, and the instructor and/or supervisor will discuss these concerns with you.

Appendix E: WHMIS 2015 Glossary of Terms

Please note: A more extensive or current version of these terms can be located at www.ccohs.ca or by searching “WHMIS 2015 Glossary, Canadian Centre for Occupational Health & Safety”

Absorption – Intake of a substance through surface areas

Accidental release measures - The steps to be taken in response to spills, leaks or releases of a hazardous product to prevent or minimize adverse effects

ACGIH – American Conference of Governmental Industrial Hygienists

Acid, Acidic – A chemical with a pH value less than 7

Active Ingredient (A.I.) – The ingredient in a chemical formulation that produces the intended effect

Acute – Of short duration

Acute toxicity – Can cause fatal, toxic or harmful effects if ingested, inhaled or comes into contact with skin

Acute toxicity estimate (ATE) – A numerical value used to evaluate acute toxicity, for example LC50 or LD50 or a converted acute toxicity point estimate that is based on an experimentally obtained range or the classification category. For example, the ATE for a mixture is calculated for oral, dermal and inhalation toxicity based on the ATE values for all relevant ingredients and the percentage concentration in the product

Aerosol – A dispersion of solid or liquid particles

AIHA – American Industrial Hygiene Association

Alkali, Alkaline – See Base, Basic

ANSI – American National Standards Institute

Antidote – A remedy used to counteract the effects of a poison

Aqueous – A term used to indicate the presence of water in a solution

Aromatic solvents – Derivatives of benzene have strong, pleasant odours. They penetrate the skin and may be inhalation hazards, for example toluene, xylene, phenol and cresol

Asphyxiants – A vapour or gas that can cause unconsciousness of death by suffocation. Two types are:

1. *Simple asphyxiants* – physiologically inert gases which, if present in excess, may dilute oxygen in air to dangerously, low levels. Common examples include methane, nitrogen and argon

2. *Chemicals asphyxiants* – prevent normal delivery of oxygen to body tissues by interfering with the uptake of oxygen by the blood (e.g. carbon monoxide) or interfering with the ability of the cells to use oxygen (e.g. hydrogen cyanide).

ASTM – American Society for Testing and Materials

Auto-ignition temperature – The lowest temperature at which a vapour from a liquid will ignite without a source of ignition
Base / Basic – A chemical with a pH value greater than 7. Can also be called alkali or alkaline

BEI – Biological Exposure Indices

Bioaccumulative potential – The potential for the substance or certain components of a mixture to accumulate in animal or plant life and possibly pass through the food chain

Biohazardous – A material that contains bacterial or viruses (germs) that can cause disease in humans

Boiling point – The temperature at which a liquid changes to a vapour at a given pressure (usually sea level pressure of 760 mm Hg 101.3kPa)

Bonding – When transferring liquid from one container to another, refers to making an electrically conductive connection between the discharge container and receiving container to eliminate the possibility of an electrical spark due to static discharge

“C” or ceiling – See “Exposure limit”

CANUTEC – Canadian Transport Emergency Centre

Carcinogen – A substance or agent capable of producing cancer in mammals

Carcinogenicity – A hazard class whose products may cause cancer, suspected of causing cancer or increasing the incidence of cancer

Carrier – A material mixed with active ingredients to make a formulation, for example finely ground clay, diatomaceous earth, water, gas propellant

CAS registry number – The identification number to a chemical substance by the Chemical Abstracts Service Division of the American Chemical Society

Caustic – A corrosive chemical with a pH value more than 7, which irritates the skin. May also be called “base” or “alkali”

CCOHS - Canadian Centre for Occupational Health and Safety

Chemical cartridge respirator – An air-purifying respirator provided with one or more cartridges specific to various gases or vapours

Chemical family – The name given to groups of chemicals that have similar structures and often share similar chemical, physical and toxicological properties. For example, chemical name: xylene, chemical family: aromatic hydrocarbons

Chemical formula – A combination of chemical symbols defining a chemical. It represents the proportions of the elements that will make it up. For example, H2O is the formula for water

Chronic – Of long duration

Closed cup – A test procedure used to measure the flash point of a product using a closed cup which prevents the vapour from escaping; generally a lower flash point than an open cup measurement

CNS – Central nervous system

Combustible – Materials that will burn are called combustibles. A combustible liquid has a flashpoint greater than 37.6oC but less than 93.3oC. A flammable liquid has a flashpoint closer to or below room temperature (16oC to 25oC). Since flammable liquids have lower flashpoints, they are considered more hazardous than combustible liquids
Combustible dusts – Products in this hazard class are in the form of finely divided solid particles that, upon ignition, are liable to catch fire or explode when dispersed in air.

Common chemical name – The simple chemical name of a chemical as opposed to its trade name or its technically precise name. For example, the pesticide with the common name carbaryl has a trade name of Sevin and the full scientific name of L-naphthyl-N-methyl carbamate.

Confidential business information (CBI) – See “Trade secret.”

Controlled product – See “Hazardous product.”

Corrosive – A material that causes visible destruction or reversible alterations in human skin tissue at the site of contact or that has a severe corrosion rate on steel or aluminum.

Critical temperature – The temperature above that a substance can exist only as a gas and cannot be converted to a liquid by pressure.

CSA – Canadian Standards Association.

Decomposition – Breakdown of a substance by heat, chemical reaction, biological decay or other processes into simpler compounds.

Density – The weight of a product for a given volume; usually measured in grams per millilitres (g/mL) or grams per cubic centimetre (g/cc).

Dermal – Used on or applied to the skin.

Dermatitis – Inflammation of the skin caused by an irritant substance.

Detoxify – To make harmless; to neutralize a poison; to remove a poisonous effect.

Dust – Solid airborne particles that a mechanically generated.

Embryotoxicity – Toxic effects to the embryo of a substance that closes the placenta barrier.

Emulsion – A mixture or two or more immiscible liquids, such as oil and water, where one is suspended or dispersed in the other in the form of minute droplets and remains suspended or dispersed for a period of time. An emulsifier may be used to assist the dispersion.

EPA – Environmental Protection Agency.

Epidemiology – The science which deals with the study of disease in the general population.

Evaporation – The transformation of a liquid or solid into a vapour.

Exposure – Contact between a person and a hazardous substance. Contact may be oral, dermal or respiratory.

Exposure limit – Restricts the amount and the length of time exposure to an air contaminant. Can be listed in mg/m3 or parts per million (ppm). Three types of limits in common use are:

1. Exposure limit – TWA – The time-weighted average concentration for a normal 8-hour workday or 40-hour work week to which nearly all workers can be repeatedly exposed without adverse.

2. Exposure Limit – STEL – The short-term exposure limit. It is the maximum concentration to which workers can be periodically exposed for a period up to 15 minutes without suffering from irritation, chronic or irreversible tissue change, or narcosis of sufficient degree so as to increase accidental proneness, or impair ability for self-rescue.
3. **Exposure Limit – C** – The ceiling concentration of an airborne substance that must not be exceeded at any time. The limit is applied to substances that are predominantly irritants or fast acting and for which the TWA is inappropriate.

**Flammable** – A flammable material will burn when it is heated or in contact with a source of ignition. By strict definition, a flammable liquid is one that has a flash point below 37.6°C (100°F).

**Flammable limits** – The upper and lower concentrations of a gas vapour in air between which an explosion or propagation of flame will occur when an ignition source is present. See also “LEL or LFL” and “UEL or UFL”

**Flammable range** – The concentration range in which a gas or vapour is flammable in air between the flammable limits. See also “LEL or LFL” or “UEL or UFL”

**Flashpoint** – The minimum temperature at which a liquid gives off enough vapour to ignite in the presence of an ignition source under specified test conditions. Flashpoints will vary for the same material depending on the method used.

**Fugitive emission** – A gas, liquid, solid, vapour, fume, mist, fog or dust that escapes from process equipment, emission control equipment or a product to which workers may be readily exposed.

**Fumes** – Solid particles in air that are generated by condensation of the vapour of a solid material (e.g. from welding).

**GHS** – Global Harmonization System of classification and labelling of chemicals

**Gas** – A substance that is in the gaseous state at an ordinary temperature and pressure.

**Hazard** – The potential for harmful effects; are evaluated by examining the properties of the product, such as toxicity, flammability and chemical reactivity.

**Hazardous product** – Any prohibited product, restricted product or controlled product.

**IARC** – International Agency for Research on Cancer

**IDLH** – Immediately dangerous to life and health

**Ignition source** – A condition such as flame, static discharge or heat capable of contributing to ignition of flammable or combustible.

**Incompatibility** – Some chemicals, when mixed together, can react violently or give off toxic vapours. For example, 2-ethoxy acetate reacts violently with strong acids and bases.

**Ingestion** – Intake of substance through the mouth.

**Inhalation** – The breathing in of a substance.

**Inhibitor** – A chemical, which is added to, another substance to prevent an unwanted chemical change from occurring.

**Irritant** – A substance which, with sufficient contact, will cause reversible inflammation of the eye, skin or respiratory system. The contact may be single or multiple.

**Primary irritants** – cause irritation at the site of contact, for example contact with many acids, caustics, amines, metallic salts and ketones.

**Secondary irritants** – can cause reactions and locations away from the site of contact. Dermatitis may be an outcome.
kPa – Kilopascals; a unit of pressure. 1 atmosphere = 101.3 kPas

Label – Includes any mark, sign, device, stamp, seal, sticker, tag or wrapper

LC – Lethal concentration

LC50 – The amount of material in air, which causes death in 50% or one half of a group of test animals when given over a period of specified time, usually 4 hours

LD50 – Lethal dose. It is a way of measuring the acute poisoning strength of a chemical when it is swallowed or rubbed on the skin. It is the dose of a material given in a single occasion which causes the death in 50% or one half of a group of test animals. LD50 exposure can be for exposure by skin, through the mouth or by injection. The smaller the LD50, the more toxic the chemical

LEL or LFL – Lower explosion limit or lower flammable limit of a vapour or a gas; the lowest concentration of the substance in air that will produce a flash of fire when an ignition source is present. At concentration lower than LEL, the mixture is too ‘lean’ to burn

Mist – Liquid droplets suspended in air that are produced by dispersion of a liquid or by condensation of a vaporized liquid

Mixture – A combination of two or more products, materials or substances that does not undergo a chemical change as a result of interaction between the products, materials or substances

Mutagenicity – The capability of a substance to cause mutations in living cells. Mutations may occur in either germ (reproductive) cells or somatic (body) cells

NFPA – National Fire Protection Agency

NIOSH – National Institute for Occupational Safety and Health

NOS – Not Otherwise Specified

Normal atmospheric pressure – An absolute pressure of 101.325 kilopascals (1.00 atmosphere) at 200C (680F)

Odour threshold – The lower airborne concentration of a chemical that can be perceived by the sense of smell

OSH - Occupational Health and Safety

Oncogenic – The ability to create tumors in tissue

Oral – Taken into the body through the mouth

OSHA – Occupational Safety and Health Administration (USA)

Oxidation – A reaction in which a substance combines with oxygen provided by an oxidizer or an oxidizing agent

PEL – Permissible exposure limit. OHSA PELs are based on an 8-hour TWA exposure

Percent volatile (by volume) – A rating scale which describes the ability of a material to evaporate. At 0% no evaporation will occur; at 100% all the material will evaporate over time. Materials with a high volatility are likely to contaminate air more rapidly than those with low volatilities

Personal Protective Equipment (PPE) – Devices worn by workers to protect against hazard sin the environment, for example respirators, gloves and face shields
pH – An expression on a scale from 0 to 14 of the extent of acidity (scale of 1) or alkalinity / causticness (scale of 14) of a substance. A pH of 7 indicates a neutral solution.

Pictogram – Refers to the stylized graphical material within a hazard symbol, i.e. skull and crossbones, or to the hazard symbol itself, i.e. health hazard symbol.

Polymerization – A chemical reaction in which one or more small molecules combine to form larger molecules. Hazardous polymerizations occur when large amounts of energy is released.

ppb – Parts per billion

ppm – Parts per million

Product Identification Number (PIN) – The number and letter, if any, specified in the Transportation of Dangerous Goods Regulations.

Reaction – A chemical transformation or change; the interaction of two or more substances to form new substances.

Reactivity – A description of the tendency of a substance to undergo chemical reaction with the release of energy. Because of reactivity due to heating, burning or direct contact, undesirable effects may include pressure build-up, temperature increase, formation of toxic or corrosive by-products.

Reducing agent – In a reduction reaction, the reducing agent is the substance which combines with oxygen or donates electrons to the reaction.

Reproductive toxicity – The effect of a product on the capability of persons or test animals to produce offspring.

Respirator – A personal protection device designed to protect the wearer from inhalation of a hazardous atmosphere.

Routes of entry – Before a chemical can cause a health effect, it must first contact and enter the body. The routes of entry are:

- Inhalation (major route)
- Ingestion (major route)
- Cutaneous / skin absorption
- Eye absorption (minor route)

SDS – Safety Data Sheet

Sensitizer – A substance, which on first exposure, causes little or no reaction on man or test animals, but which on repeated exposure may cause a marked response not necessarily limited to the contact site. Most common in industry, skin sensitization may occur, although respiratory sensitization also occurs.

Smoke – Aerosols, gases and vapours resulting from incomplete combustion.

Solubility in water – The weight in grams of material that will dissolve in a litre of water at 200C. Materials which are highly soluble may be absorbed from the air through the moist membranes of the nose, eyes and mouth.

Solvent – A liquid which will dissolve another substance.
Specific gravity – The weight of material compared to the weight of an equal volume of water, for example specific gravity of less than 1.0 will float in water, while greater than 1.0 will sink

TDG – Transportation of Dangerous Goods

Teratogenicity – An agent that can produce congenital anomalies or birth defects or increase the incidence of an anomaly in the population

TLV – Threshold Limit Value. A term used by the ACGIH to express the airborne concentration of a material to which nearly all persons can be exposed day after day, without adverse effect

Toxicity – The adverse effects resulting from exposure to a material, generally by the mouth, skin or respiratory tract

Trade secret – Product information withheld from labels and SDS

TWA – Time Weight Average. The airborne concentration to which a person is exposed when calculated as a weighted average over a period of time

UEL or UFL – Upper explosive limit or upper flammable limit of a vapour or gas; the highest concentration of the substance in air will produce a flash of fire when an ignition source is present. At higher concentrations, the mixture is too ‘rich’ to burn

Unstable – Tending toward decomposition or other unwanted chemical change during normal handling or storage

Vapour – The gaseous form of a substance that is found in a solid state at normal atmospheric pressure of 101.325 kPa at 20°C

Vapour density - The density of a gas or vapour relative to air, where air = 1

Volatility – The ease with which a material evaporates

Warning properties – The capability of chemicals to be noticed by human senses at levels in the air below those which may cause ill health effects

WHMIS – Workplace Hazardous Materials Information System

Workplace Contamination Limit (WCL) – Enforceable limits on the amount of a hazardous substance that a worker can be exposed to on the job. In Saskatchewan, this can be found in Table 21 of The Occupational Health & Safety Regulations, 1996
